RESOLUTION NO. 2018 - 57

A RESOLUTION OF THE BOARD OF DIRECTORS
OF THE CALAVERAS COUNTY WATER DISTRICT

ADOPTION OF THE COPPER COVE WATER SYSTEM MASTER PLAN,
OCTOBER 2018, CIP 11064C-120

WHEREAS, in order to better serve current and establish needs, and future raw and potable water customers in the Copper Cove water service area, a water master plan update has been developed for the community; and

WHEREAS, Peterson Brustad, Inc. was retained by the District in 2016 to prepare the water master plan update which is a replacement of the prior Copper Cove Water System Master Plan previously adopted by Resolution 2005-43 in June 2005; and

WHEREAS, the Board of Directors received the Draft Copper Cove Water System Master Plan at a public meeting on August 22, 2018 at which time a presentation was given for the purpose of receiving Board, staff, and public comment which have been incorporated into the October 2018 version submitted to the Board for consideration; and

WHEREAS, the Board of Directors of the CALAVERAS COUNTY WATER DISTRICT recognizes that a separate financial analysis and evaluation will be required to address capacity fees to fund the costs of the recommendations within said plan update; and

NOW, THEREFORE, BE IT RESOLVED, the Board of Directors of the CALAVERAS COUNTY WATER DISTRICT hereby adopts of the Copper Cove Water System Master Plan, dated October 2018 attached hereto and made a part hereof.

PASSED AND ADOPTED this 10th day of October, 2018 by the following vote:

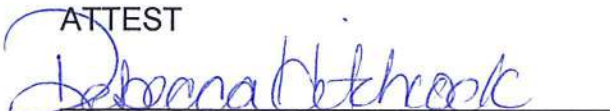

AYES: Directors Strange, Thomas, Underhill, and Ratterman
NOES: None
ABSTAIN: None
ABSENT: Director Davidson

CALAVERAS COUNTY WATER DISTRICT

Scott Ratterman, President
Board of Directors

Introduction

This Copper Cove Water System Master Plan (WMP) update was authorized by Calaveras County Water District (District) Resolution 2016-44. The prior Copper Cove WMP was completed in 2005 and the District's goal is to update water and wastewater master plans approximately every ten years.

This report will provide a basis for the management of rehabilitation existing assets and the expansion of the District's potable water facilities to meet community approved growth. Computer aided hydraulic water system modeling, and findings from evaluation of District facility assets, were utilized in development of the report's capital and rehabilitation and replacement projects. These projects include triggers for implementation.

Developed of the Copper Cove WMP started prior to passage of California AB 1668 and impacts of the bill were not evaluated in this report.

Purpose and Specific Objectives

The purpose of this master plan report is to describe water supply, treatment, storage, and distribution system improvements required to meet current and future service area needs. In particular, this master plan report provides the following information:

- ◆ Delineation of the service area.
- ◆ Characterization of historic water demands, including existing and projected average day, maximum day, and peak hourly demands.
- ◆ Description and evaluation of the existing facilities.
- ◆ Identification of the improvements needed to meet growth, improve operations, comply with current and known future regulations, and correct deficiencies.
- ◆ Recommendations for system improvements needed to serve buildout conditions.
- ◆ Timelines and cost information for constructing the recommended improvements.

Existing System

Existing Service Area

The service area encompasses the communities of Copper Cove, Copperopolis, Saddle Creek, Lake Tulloch Shores, Calypso Beach, Connor Estates, Copper Meadows, and Peninsula Estates. The service area is defined by the *2017 Calaveras County Water District Sphere of Influence Report*¹. The topography ranges from 1,150 feet to 550 feet above mean sea level (MSL). Hot summers and cool winters characterize the region, with temperatures ranging from the low 40's to the mid 100's.

These communities include a total of 2,562 existing connections spread out across the 5,152-acre service area according to records provided in 2017. The current facilities include one raw water pump station diverting water from the North Fork Stanislaus River located on the west shore of Lake Tulloch, one water treatment plant (Copper Cove WTP), three treated water pump

¹ *Calaveras County Water District (CCWD) Sphere of Influence Report, April 2017.*
https://www.calaveraslafco.org/uploads/1/1/4/5/11454087/ccwd_soi_april_2017.pdf

stations, five treated water storage tanks, and the associated distribution system. A general map of the existing facilities is presented in Figure 1.

Water Supply

Raw water is supplied to the Copper Cove WTP from Lake Tulloch. A two-stage 4.75-mgd capacity pumping system conveys water from the lake to the WTP through the existing 24-inch raw water main. The first stage consists of two 1,650-gpm pumps (2-duty, 1-spare) and the second stage consists of three 1,750-gpm pumps (lead-lag-standby). In addition to the WTP, irrigation water is also seasonally supplied to Saddle Creek Golf Course. The demand from the golf course irrigation requirement decreases the available water supply, in peak periods, by approximately 1.0-mgd (approximately 700-gpm). The water available to supply the WTP during peak periods is approximately 2,600-gpm (3.75-mgd).

Lake Tulloch is owned and operated by the Tri-Dam Project and has a max capacity of approximately 65,000 AF. Lake Tulloch is fed by the surrounding 980 square mile drainage area and the New Melones Reservoir. The New Melones Reservoir has 2,420,000 AF and is immediately upstream of Lake Tulloch.

Raw water is drawn through an intake on the Black Creek arm of the Lake Tulloch Reservoir. The 2013/2014 drought conditions led Tri-Dam Project to consider lowering the surface water elevation in Lake Tulloch, should the drought continue. This prompted the District to relocate the intake. In 2015 the District completed the intake relocation extending the intake length and lowering the intake from 470-ft to 390-ft above MSL. Two of three intakes were moved to the lower elevation. One pump remains at the higher elevation. Relocating the raw water pumps has increased influent raw water turbidity levels and the District is working to move one of the lower pumps back to its original elevation. When complete, the District will have two pumps at 470-ft above MSL and one pump at 390-ft MSL.

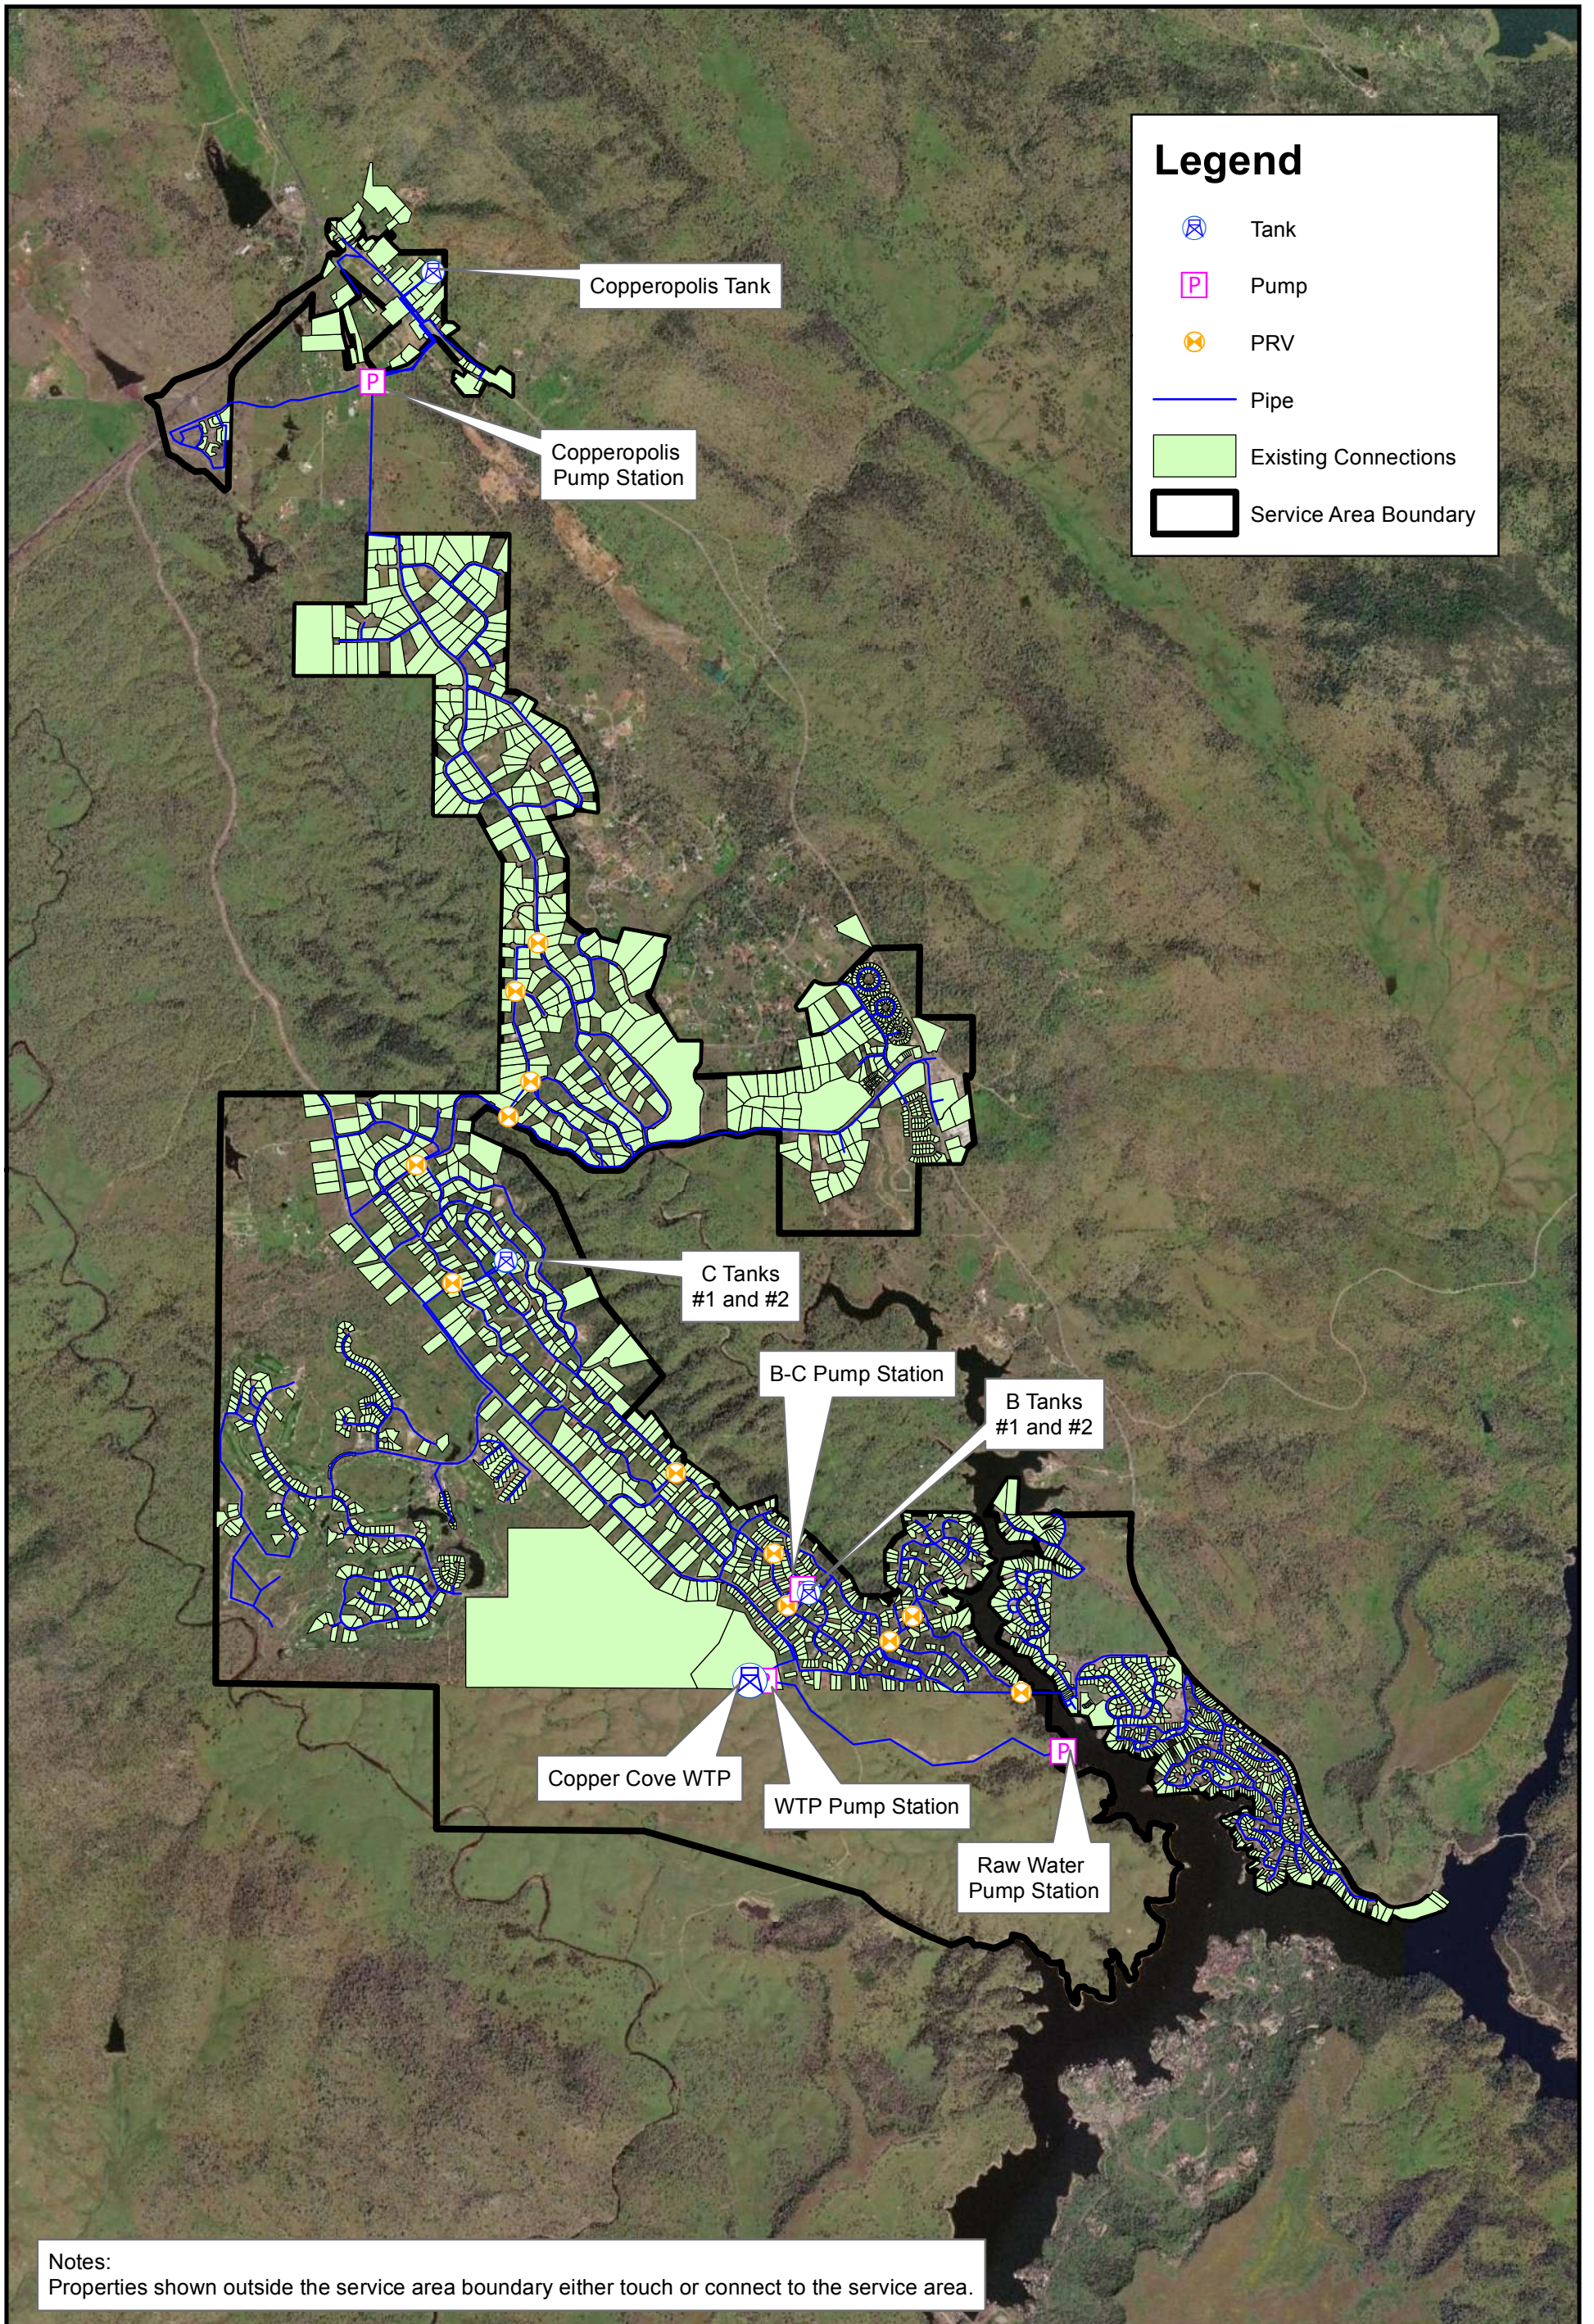

The District maintains Pre-1914 and Post-1914 water rights that allow the District to Divert up to 6,000 AF/yr to supply treated and raw water demands. These water rights can be increased if the District were to file a change petition with the SWRCB and demonstrates a need for an increased supply to the Copper Cove service area. Pursuant to contractual arrangements with NCPA and the Utica Power Authority, the District can also access pre-1914 water supplies from the North Fork Stanislaus stem after it is used for power purposes.

Water Treatment Facilities

The Copper Cove WTP was constructed in 1998 to supply treated water to the Copper Cove and Copperopolis communities. The WTP has a rated capacity of 4-mgd and has room to expand the capacity to 10-mgd. Treatment capacity is provided by two 2-mgd filter units. Service failure of one unit reduces the capacity of the WTP by half.

Treatment consists of pre-ozonation, micro-filtration, and disinfection with sodium hypochlorite. Pre-ozonation provides taste and odor control, as well as TOC and disinfection by-product reduction. A 300,000-gallon clearwell provides contact time prior to delivering water to the distribution system.

Staff operating the WTP reported significant increases in influent turbidity levels and manganese following the relocation of the raw water pumps. The average influent turbidity rose from 0.1 to 0.2 NTU to 1.5 to 2.0 NTU. Daily operations now require additional ozone, coagulant and backwash as a result of the turbidity increase.

Notes:
 Properties shown outside the service area boundary either touch or connect to the service area.

Treated Water Distribution System

The distribution system is operationally divided into ten pressure zones. The pressure zones allow water to be delivered at acceptable pressures to customers over a large range of elevations. The pressure zones are supplied by one of the five existing storage tanks: B Tanks (#1 and #2), C Tanks (#1 and #2) and the Copperopolis Tank. All the pressure zones are gravity fed from their respective storage tank. The pressure zones are summarized in Table 1, which presents the elevation ranges and the pressure ranges throughout each zone. The low-pressure conditions are given for the peak hour demand scenario and the high-pressure conditions are given for static pressure. The low-pressure condition assumes all storage tanks are half full tank and the high-pressure condition assumes all storage tanks are full.

Table 1. Copper Cove Pressure Zones

Pressure Zone	Storage Supply	Elevation Range		PHD Low Pressure Condition (psi)	Static High Pressure Condition (psi)
		Low (ft)	High (ft)		
B1	B Tanks	567	986	31 ¹	110
B2	B Tanks	673	735	80	107
B3	B Tanks	525	673	42	106
B4	B Tanks	499	645	41	105
C1	C Tanks	651	1,138	32 ¹	160 ²
C2	C Tanks	811	951	46	108
C3	C Tanks	566	813	64	137
C4	C Tanks	618	949	67	150
C5	C Tanks	735	901	39	108
Copperopolis	Copperopolis Tank	883	1,006	51 ¹	110

¹ Low pressure for zones served by tanks is based on the lowest pressure at a distribution node.

² High pressure is given for highest pressure at a distribution node and not the force main connecting Zone C1 to Zones C3 and C4.

Treated Water Pumping Stations & Control Valves

The boundaries between pressure zones are defined by booster pumping stations, pressure regulating valves (PRVs), and isolation valves. Information about the booster pumping stations is summarized in Table 2. Information about the PRVs is summarized in Table 3. PRVs used to serve individual homes and cul-de-sacs have been omitted from this report.

Table 2. Copper Cove Pump Stations.

Station	Description	Model ID	Design Head (ft)	Design Flow (gpm)
WTP Pump Station	From Clearwell to B Tank	PMP-1	244	2,600

¹ Elevations and settings from InfoWater model, unless updated values were provided by the District.

Treated Water Storage Facilities

The existing water system includes five storage tanks and one clearwell that provide water storage for fire flow, emergency, and operational needs. These tanks are summarized in Table 4.

Table 4. Copper Cove Water Storage Tanks.

Name	Model ID	Type	Nominal Volume (gallons)	Ground Elevation (ft)	Diameter (ft)	Maximum Water Depth (ft)	Overflow Elevation (ft)
WTP Clearwell	WTP	Concrete	300,000	NA	NA	NA	NA
B1 Tank #1	B	Redwood	300,000	980	55.0	17.0	997
B1 Tank #2	B2	Welded Steel	750,000	980	65.0	30.0	1,010
C1 Tank #1	C	Welded Steel	543,000	1,140	60.0	26.0	1,166
C1 Tank #2	C2	Welded Steel	543,000	1,140	60.0	26.0	1,166
Copperopolis Tank	COPPER	Welded Steel	500,000	1,111	57.0	26.5	1,138

Treated Water Pipelines

The distribution system model includes approximately 54 miles of distribution pipe ranging from 4-inches to 30-inches in diameter as shown in Figure 1. The smallest distribution pipe diameter found in the model is four inches. Figure 1 does not show some distribution lines in many of the

cul-de-sacs, which in many cases are two inches in diameter. Table 5 summarizes the distribution system characteristics from the distribution system model. Pipeline materials vary throughout the distribution system. Pipeline materials include asbestos concrete, polyvinylchloride, ductile iron and steel.

Table 5. Distribution System Characteristics.

Pipe Diameter (in)	Total Length of Pipe (miles)
4	1.15
6	23.65
8	17.83
10	9.60
12	3.37
16	0.10
18	0.37
20	2.22
24	0.06
30	0.02
Total Length	54.38

Existing and Projected (Buildout) Demands

Existing System Demand

The existing system demands are presented in Table 6. The average daily demand (ADD) has been adopted from the 2015 Urban Water Management Plan (2015 UWMP), while the maximum daily demand (MDD) is equal to the maximum daily production on record between 2008 and 2016. For comparison, the historic water records are presented in Table 7. The historic records present an ADD less than that adopted from the UWMP. The UWMP ADD was selected to represent the existing system to provide consistency between planning documents and to be conservative. The existing ADD is 1.58-mgd and the existing MDD is 2.69-mgd. The peak hour demand (PHD) is 4.04-mgd. The PHD was calculated using CCWD’s MDD:PHD peaking factor of 1.5. Losses represent multiple issues including leakage, undocumented water consumption, and inaccurate customer meters.

Table 6. Existing System Demands

User Type	Existing ADD (MGD)	Existing MDD (MGD)	Existing PHD (MGD)	ADD: MDD Peaking Factor
Residential	0.76	1.30	1.95	1.71
Landscape	0.01	0.02	0.02	2.00
Public Service	0.01	0.01	0.02	1.00
Commercial	0.14	0.24	0.37	0.24
Losses	0.61	1.12	1.68	1.12
Total	1.58	2.69	4.04	1.70

Table 7. Historic Water Demands

Year	ADD (MGD)	MDD (MGD)	ADD: MDD Peaking Factor
2008	1.41	2.62	1.86

Year	ADD (MGD)	MDD (MGD)	ADD: MDD Peaking Factor
2009	1.24	2.69	2.17
2010	1.14	2.54	2.22
2011	1.19	2.40	2.01
2012	1.28	2.47	1.93
2013	1.37	2.53	1.84
2014	1.10	2.36	2.15
2015	0.96	1.79	1.87
2016	1.11	2.41	2.17
Maximum	1.41	2.69	2.22

Peaking Factors

Peaking factors define the relationship between ADD and MDD and the relationship between MDD and PHD. These peaking factors will be used to model both the existing system and the buildout system. The maximum day and peak hour peaking factors proposed for the 2018 Master Plan are as follows:

- Existing ADD:MDD Peaking Factor – 1.70 (per Table 6)
- Buildout ADD:MDD Peaking Factor – 2.22 (per Table 7)
- MDD:PHD Peaking Factor – 1.5 (per the District’s *Design and Construction Standards*)

Existing and buildout peaking factors are unique due to the use of the 2015 UWMP ADD which distorts the historic relationship between ADD and MDD. Using a single peaking factor would result in an erroneous buildout MDD; therefore, unique peaking factors are defined.

Buildout System Demand

The average daily water demand at buildout was determined by calculating and summing the demand for each user type. Residential demands were calculated by multiplying the buildout population (16,513 people) by the mean residential per capita user demand (173 gallons per person-day). The mean residential per capita user demand derived from the 2015 UWMP. Using this metric to project future water demands is consistent with SB 20x2020 water conservation goals. See Table 8 for how the mean residential per capita demand was derived.

Table 8. Residential per Capita Water Demand

Year	Existing	2020	2025	2030	2035	2040
Copper Cove Population	4,416	4,708	4,944	5,127	5,280	5,373
Single Family Demand (AF/yr)	856	912	958	994	1023	1041
Residential Demand (AF/yr-person)	0.194	0.194	0.194	0.194	0.194	0.194
Mean Residential Demand (AF/person-yr)	0.194					
Mean Residential GPCD (gal/person-day)	173					
ADD Per Connection (gal/day-connection)	417					

The average daily water demand at build out is projected to be 5.4-mgd. The buildout ADD was determined by summing residential, commercial, public service, landscape and water loss demands. The buildout MDD and PHD were calculated based on the buildout ADD:MDD peaking factor (2.22) and MDD:PHD peaking factor (1.5) defined in the previous section. The buildout system demands are summarized in Table 9.

Table 9. Buildout System Demands

User Type	Buildout ADD (MGD)	Buildout MDD (MGD)	Buildout PHD (MGD)
Residential	2.86	6.34	9.51
Commercial	0.09	0.20	0.31
Public Service	0.11	0.25	0.37
Landscape	0.06	0.14	0.21
Losses	2.23	4.94	7.41
Total	5.35	11.87	17.81

The commercial, landscape, and public service buildout demand factors were adopted directly from Appendix F of the 2015 UWMP and used to calculate the buildout water demand.

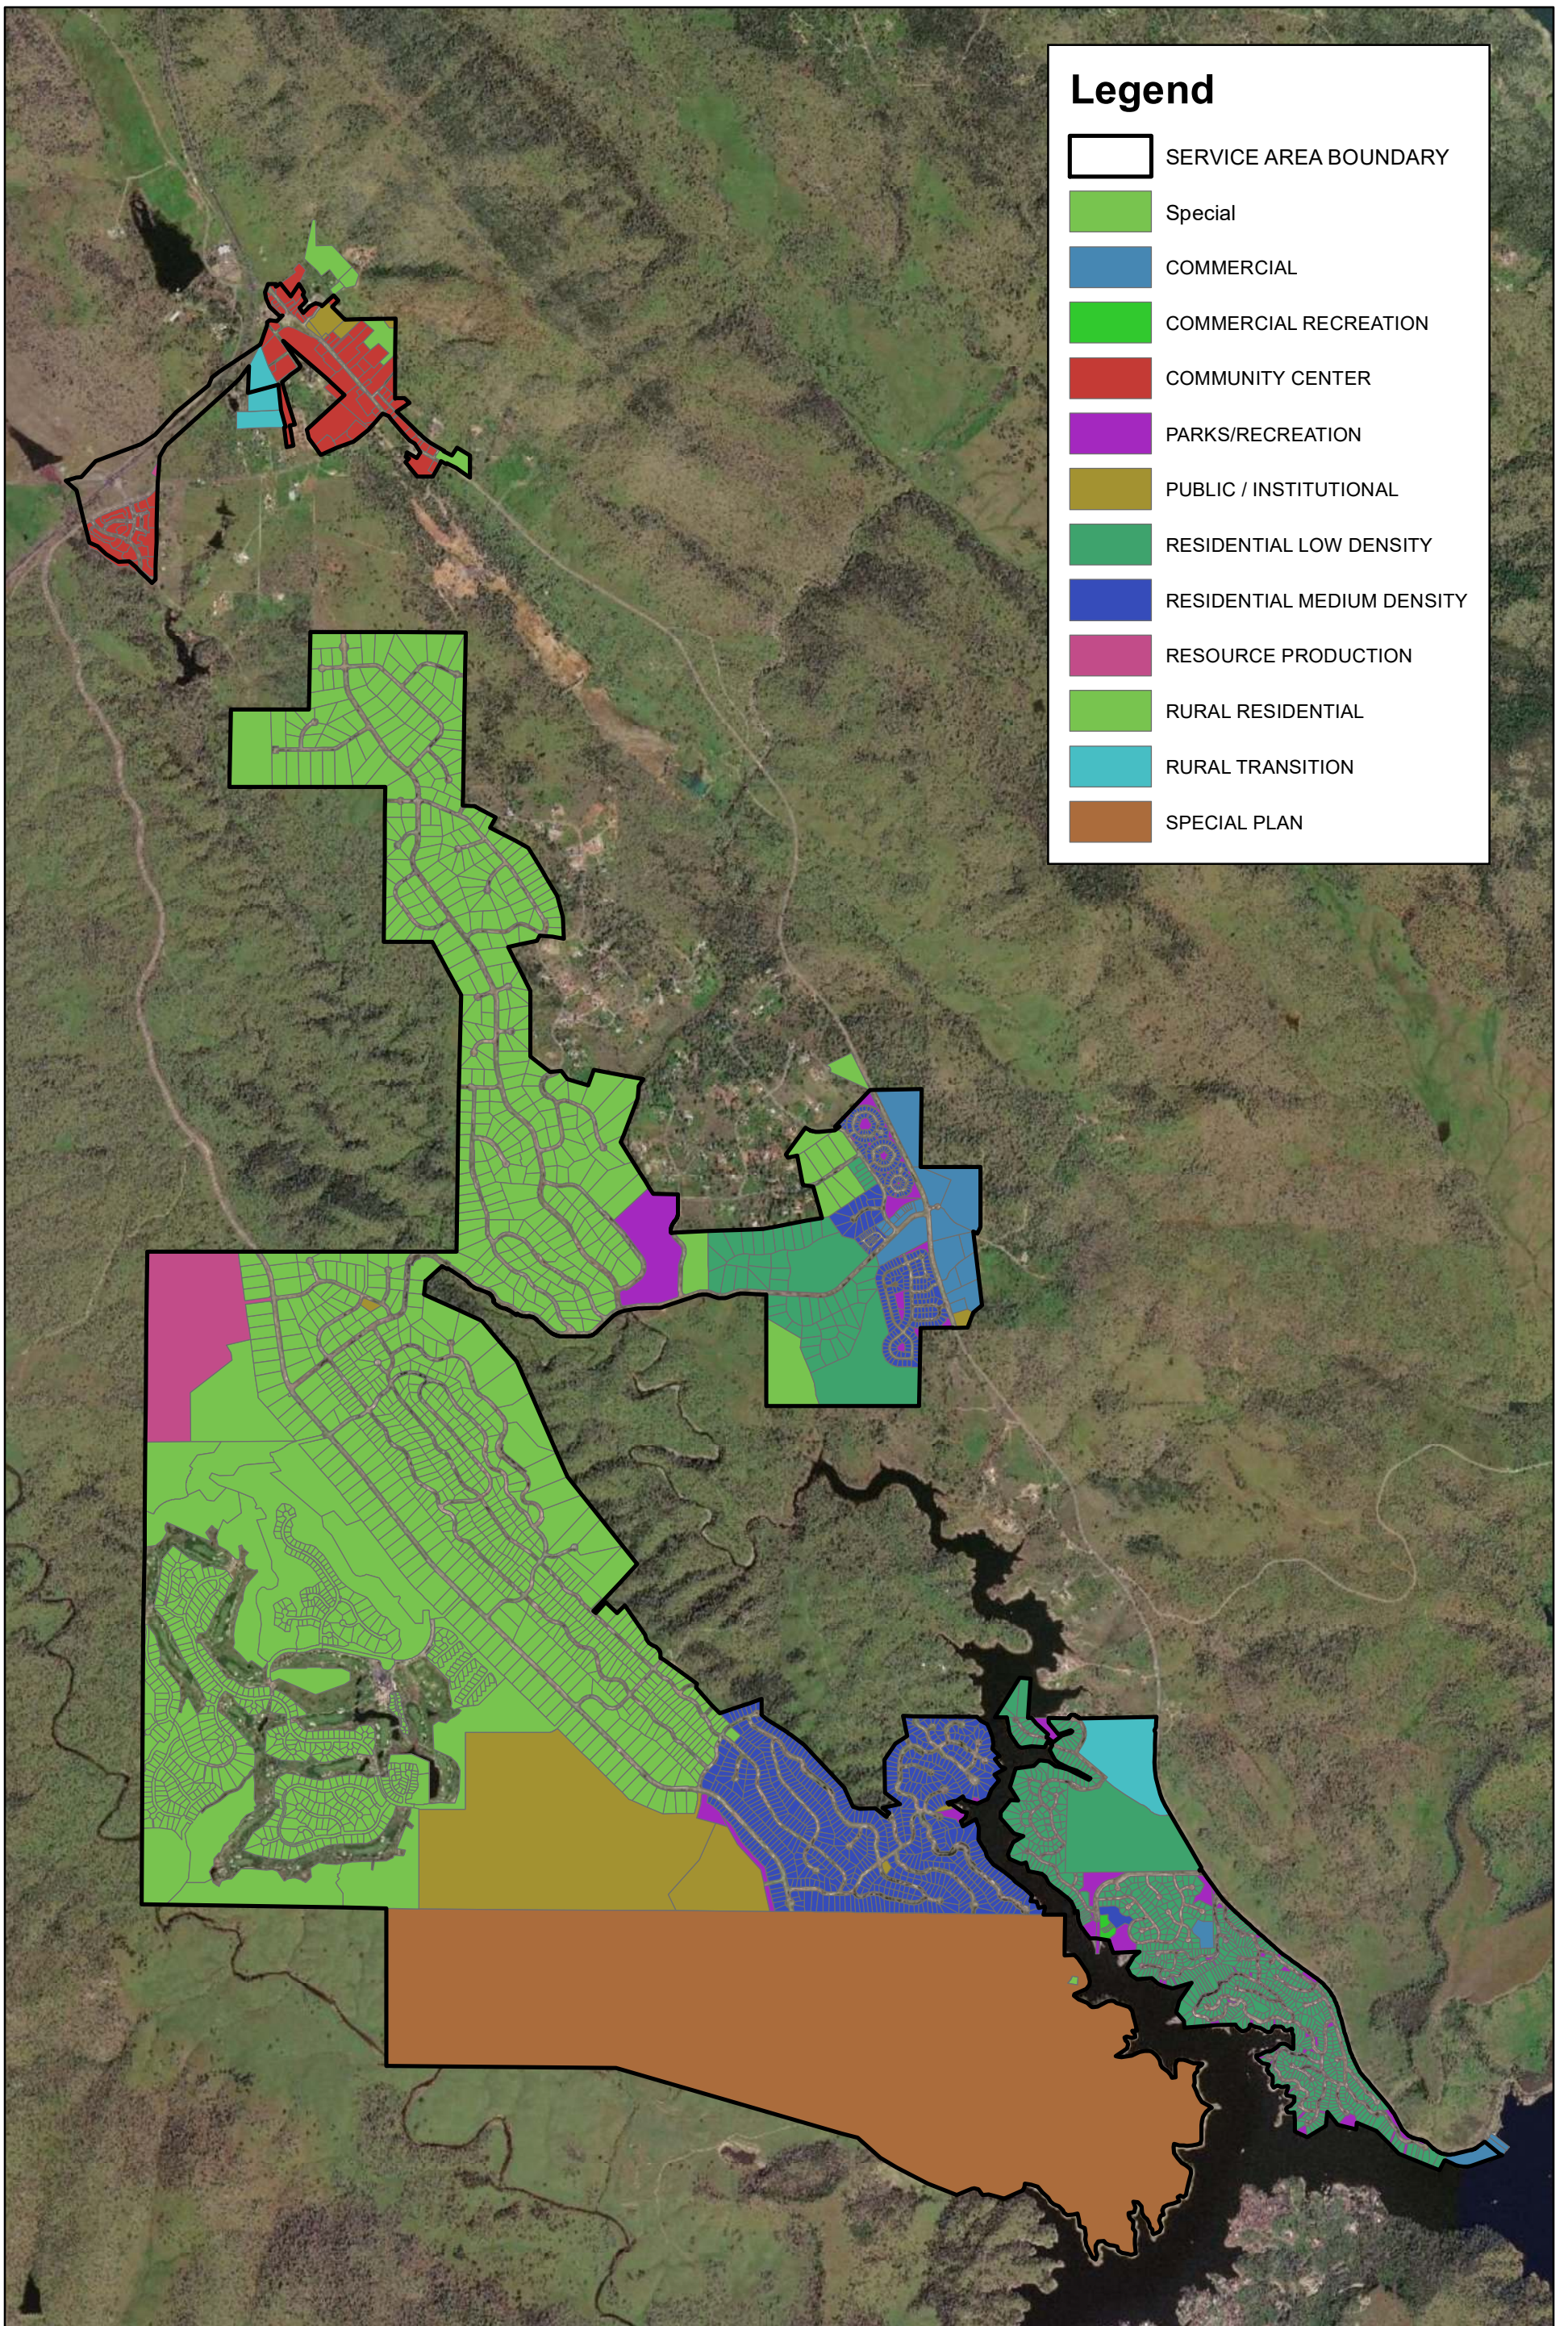

Losses at buildout were projected by deriving the percentage of water losses presented in the 2015 UWMP. Similar to the residential GPCD, losses are consistently 42 percent of the residential and non-residential (commercial, irrigation, and landscape) demands for all future demand projections. To be consistent with the 2015 UWMP, this relationship was used to calculate the average daily loss demand at buildout. Table 10 presents demand data from the 2015 UWMP to support the water loss evaluation.

Table 10. Water Loss Evaluation

Water User Type	Existing ADD (MGD)	2020 ADD (MGD)	2025 ADD (MGD)	2030 ADD (MGD)	2035 ADD (MGD)	2040 ADD (MGD)
Residential	0.76	0.81	0.86	0.89	0.91	0.93
Commercial	0.01	0.01	0.01	0.01	0.01	0.01
Public Service	0.01	0.01	0.01	0.01	0.01	0.01
Landscape	0.14	0.15	0.16	0.17	0.17	0.18
Losses	0.65	0.70	0.74	0.76	0.79	0.80
Total	1.58	1.68	1.77	1.83	1.89	1.92
Percent Losses	0.42	0.42	0.42	0.42	0.42	0.42

Infill Evaluation

The Copper Cove service area has yet to reach buildout and has considerable room to support future developments. Of the 7.5 square miles within the service area, only 3.2 square miles have been developed. The remaining 4.3 square miles provides room for future connections to be served by the WTP. A map presenting complete infill by land use type consistent with the 2016 Draft Calaveras County General Plan Update is presented in Figure 2.

Legend

- SERVICE AREA BOUNDARY
- Special
- COMMERCIAL
- COMMERCIAL RECREATION
- COMMUNITY CENTER
- PARKS/RECREATION
- PUBLIC / INSTITUTIONAL
- RESIDENTIAL LOW DENSITY
- RESIDENTIAL MEDIUM DENSITY
- RESOURCE PRODUCTION
- RURAL RESIDENTIAL
- RURAL TRANSITION
- SPECIAL PLAN

Approximately 6,852 total residential connections are anticipated at buildout. The total number of residential connections represents the sum of existing connections, existing connection subdivisions, planned connections and unplanned connections. A summary of infill connections is presented in Table 11. Existing connections larger than three times the average land use parcel size were assumed to be subdivided at buildout, these connections represent the existing connection subdivisions. Planned connections include the 300 connections planned for the Tuscany Hills development and the 300 connections planned for the Copper Mill development. Unplanned infill connections include those anticipated in unplanned and undeveloped areas. Unplanned connections were calculated by dividing the total unplanned undeveloped area for each land use type by the respective land use density.

Table 11. Residential Connections at Buildout

Residential Land User Type	Existing Parcel Density (Ac/Conn.)	Unplanned Buildout Area (Ac)	Existing Residential Conn.	Existing Conn. Subdivisions	Planned Conn.	Un-planned Infill Conn.	Total Conn. Per User Type
Low Density	2.72	413	718	214	300	403	1,635
Medium	3.97	293	629	15	0	532	1,176

Transition	0.20	51	2	0	0	8	10
Special	2.72	1,980	338	35	300	2,060	2,733
Community Center	2.72	100	48	72	0	133	251
Total Residential Connections			6,852				

Buildout Population

The District is projected to serve approximately 16,510 people at buildout. The buildout population was determined based on the 6,852 buildout connections and the District’s planning standard of 2.41 residents per residential connection.

Buildout Year

Copper Cove is assumed to grow at the same rate as the County; therefore, growth rates have been adopted from the 2017 Department of Finance (DOF) population growth rates for Calaveras County. The growth rates are consistent with the UWMP. The DOF growth rates are projected until year 2060. Projections beyond 2060 were assumed to equal the 2055-2060 growth rate, which is the highest incremental growth rate. Table 12 presents the DOF population growth rates in 5-year increments. Buildout is not projected to occur within the next fifty years based upon DOF growth projections.

Table 12. Calaveras County Growth Rates per California Department of Finance, 2017

5-year Period	2016 - 2020	2021 - 2025	2026 - 2030	2031 - 2035	2036 - 2040	2041 - 2045	2046 - 2050	2051 - 2055	2056 - 2060
5-year Incremental Growth Rate	0.59%	2.17%	2.14%	1.53%	0.82%	0.46%	0.64%	1.28%	2.17%

Model Demand Factors

Water demands have been modeled according to user type and were distributed on a demand per acre basis. Demand factors used to distribute water throughout the existing and buildout systems are provided in Table 13. The aforementioned peaking factors were used to scale the demand factors and model MDD and PHD.

Table 13. Existing and Buildout Demand Factors

User Type	Existing			Buildout		
	Area (ac)	ADD (MGD)	Demand Factor ¹ (gpm/ac)	Buildout Area (ac)	ADD (MGD)	Demand Factor ² (gpm/ac)
Residential	1,503	1.53	0.35	4,366	2.86	0.77
Landscape	52	0.14	1.91	78	0.06	0.87
Public Service	260	0.01	0.02	299	0.11	0.57
Commercial	86	0.01	0.07	178	0.09	0.67
Losses ³	1,937	0.66	0.24	4,922	2.22	0.31

¹ Existing demand factors were all calculated based on the demands presented in the 2015 UWMP and the area associated with the respective user type

² The buildout demand factor for the residential user type was calculated based on the residential buildout demand and the associated area. The buildout demand factors for landscape, public service, commercial user types were adopted for the 2015 UWMP.

³ Water losses are distributed evenly throughout the existing and buildout system models across the total area of all user types.

Demand Distribution

Existing and buildout demands were allocated throughout the model and summed to estimate the demand within each pressure zone. This process was repeated to estimate the demand by tank zone. The allocations of demands by pressure zone are shown in Table 14 and by tank zone in . Figure 3 presents a map of the system pressure zones.

Table 14. System Demand by Pressure Zone.

Pressure Zone	Baseline MDD (mgd)	Buildout MDD (mgd)
B1	0.28	3.13
B2	0.01	0.05
B3	0.07	0.22
B4	0.33	0.96
C1	0.29	0.92
C2	0.22	0.96
C3	0.26	1.24
C4	0.65	1.51
C5	0.46	2.34
Copperopolis	0.11	0.66

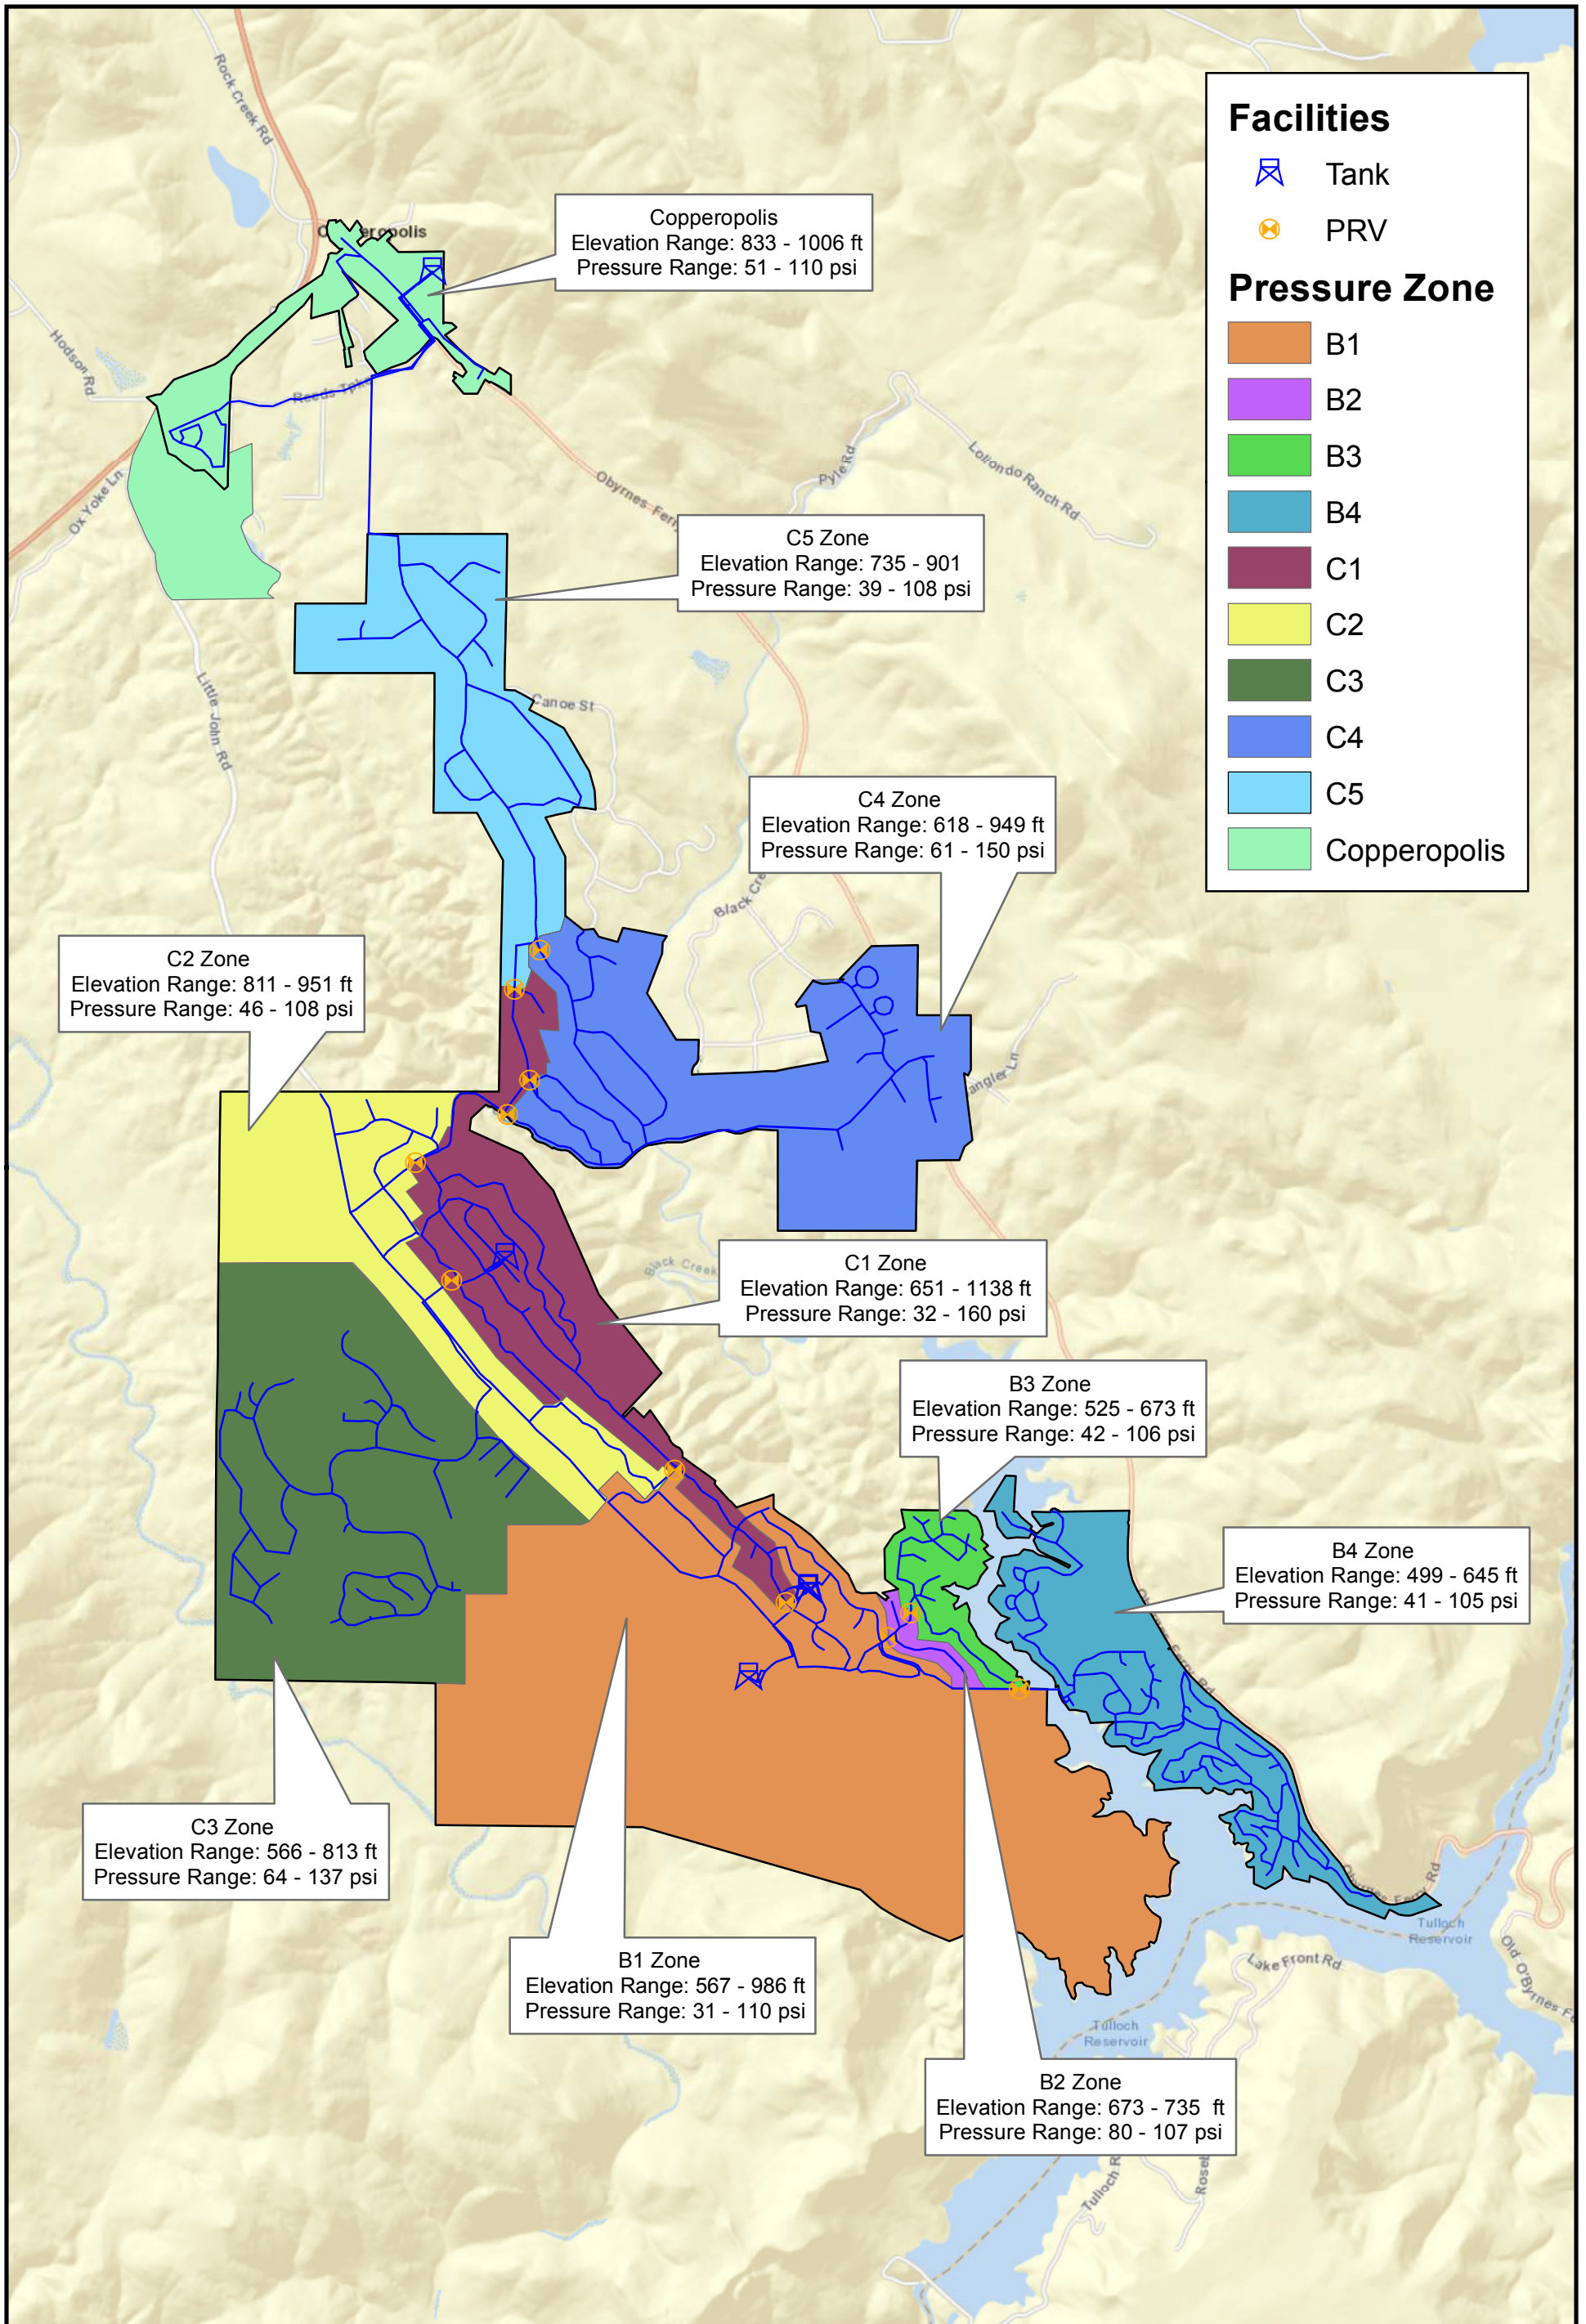

Table 15. System Demand by Tank Zone.

Tank Zone	Baseline MDD (mgd)	Buildout MDD (mgd)
B Tank	0.68	4.36
C Tank	1.89	6.96
Copperopolis Tank	0.11	0.66

Existing and Future Regulations

Drinking Water Regulations

The quality of the water provided by existing and any future facilities must meet all existing and proposed regulatory requirements. A summary of the existing and proposed drinking water quality regulations covering surface water and groundwater sources is below.

Background

The Safe Drinking Water Act (SDWA) of 1974 gave the United States Environmental Protection Agency (EPA) the authority to set standards for contaminants in drinking water supplies. The EPA established primary regulations for the control of contaminants that affect public health and secondary regulations for compounds that affect the taste, odor or aesthetics of drinking water. Under the provisions of the SDWA, the California Department of Drinking Water (DDW) has the primary enforcement responsibility. Title 22 of the California Administrative Code establishes DDW authority and stipulates State drinking water quality and monitoring standards.

Existing and Proposed Federal Regulations

The EPA has recently finalized and is in the process of finalizing several new regulations since the 1986 and 1996 Amendments to the SDWA. These regulations address both surface water and groundwater. Significant final and proposed regulations are shown in Table 16. The schedule for promulgation of the Safe Water Drinking Act Regulations (Current as of 2015) is shown in Table 17.

Table 16. Recently Adopted and Proposed Federal Regulations.

Regulations	Year Rule Finalized	Targeted Contaminants
National Interim Primary Drinking Water Regulations	1975	Set maximum levels for a wide variety of contaminants
Total Trihalomethanes	1979	Trihalomethanes
Fluoride Rule	1986	Fluoride limits
Surface Water Treatment Rule	1989	Giardia lamblia, viruses, Legionella and heterotrophic plate count
Total Coliform Rule	1989	Representative sampling of the distribution system for total and fecal coliform
Phase II Rule (organics)	1991	VOCs, SOCs and IOCs
Lead and Copper Rule	1991	Lead and copper corrosion products
Phase V Rule (organics)	1992	VOCs, SOCs and IOCs
Source Water Protection	1997	Delineate boundaries and determine origins and susceptibility of water supplies to contamination
Stage 1 Disinfection/Disinfection By-products Rule (D/DBPR)	1998	Disinfection Byproducts (THMs and HAAs); compliance date for systems serving greater than 10,000 was January 2002
Interim Enhanced Surface Water Treatment Rule (IESWTR)	1998	Giardia, Cryptosporidium, Turbidity, DBPR profiling
Variance and Exemptions Rule	1998	Variance and exceptions to help public water systems achieve compliance with MCLs
Arsenic Rule	2001	Arsenic
Filter Backwash Rule	2001	Filter backwash recycle
Long-term 1 Enhanced Surface Water Treatment Rule	2002	Microbiological, Turbidity and control of DBPs
Public Health Security and Bioterrorism Prevention and Response Act	2002	Vulnerability Assessments
Radon Rule	2004	Radon
Contaminant Candidate List 2	2004	CCL1 required no new regulated contaminants, CCL2 may include perchlorate, metolachor and MTBE
Stage 2 Disinfectants/Disinfection Byproducts Rule	2004	Introduces locational running annual average compliance for the 80/60 TTHM/HAA5 requirements
Long-term 2 Enhanced Surface Water Treatment Rule	2006	Introduction of microbial toolbox for control of Cryptosporidium
Groundwater Rule	2004	Microbial protection of groundwater supplies
Reduction of Lead in Drinking Water Act (RLDWA)	2011	Use of lead free pipes, fittings, fixtures, solder and flux for drinking water
Revised Total Coliform Rule	2014	E Coli and Total Coliforms
Drinking Water Protection Act (DWPA)	2015	Algal Toxins ¹
<p>¹ The DWPA is an amendment to the SWDA. It requires Congress to develop a strategic plan to assess and manage the risks associated with algal toxins in public drinking water supplies. No new regulations were imposed with the amendment to the SWDA.</p>		

Table 17. Schedule for Promulgation of Safe Water Drinking Act Regulations (Current as of 2015).

Regulation	Proposed	Final	Effective
Fluoride	11/85	4/86	10/87
Trihalomethanes	2/78	11/79	11/83
8 VOCs (Phase I)	11/85	7/87	1/89
Surface Water Treatment Rule (SWTR)	11/87	6/89	6/93
Coliform Rule	11/87	6/89	12/90
Lead and Copper	8/88	6/91	1/92 ^a
Minor Revisions to Lead and Copper	4/98	1/00	1/01
26 Synthetic Contaminants ^h , Seven Inorganic Contaminants (Phase II)	5/89	1/91 ^b	7/92
MCLs for barium, pentachlorophenol (Phase II)	1/91	7/91	1/93
Phase V Organics, Inorganics	7/90	7/92	1/94
Radionuclides (Phase III) Except Radon	4/00	12/00	12/03
Radionuclides (Phase III) Radon	11/99	8/01 ^c	8/04 ^d
Sulfate	12/94	Decision on whether to regulate due 8/01	
MCLs for aldicarb, aldicarb sulfoxide, aldicarb sulfone	Administrative hold; no current schedule available		
Disinfectants/Disinfection Byproducts, Stage 1 DBPR	7/94	12/98 ^c	1/02 ^{f,g}
Disinfectants/Disinfection Byproducts, Stage 2 DBPR	9/01	5/02	5/058
Information Collection Rule	2/94	5/96	Completed
Interim ESWTR	7/94	12/98 ^c	1/02 ^f
Interim ESWTR, Stage 1 Long Term Enhanced SWTR	4/00	8/01	1/047
Interim ESWTR, Stage 2 Long Term Enhanced SWTR	9/01	5/02	5/05
Filter Backwash Recycle Rule	4/00	6/01	12/0 ^c
Consumer Confidence Reports Rule	2/98	8/98	9/98
Ground Water Rule (GWR)	5/00	11/01	6/04
Operator Certification, State Guidance	3/98	2/99	2/01
Unregulated Contaminants, Monitoring Only ⁱ	2/99	9/99	1/01
Five New Drinking Water Contaminants	8/00	8/01	8/04
Chlorine Gas as Restricted Use	9/00	10/01	10/03
Source Water Protection Program, Guidance ^e	8/97	Completed	Completed
Arsenic Rule	6/00	1/01	1/06
Revised Total Coliform Rule	-	4/14	4/16

Notes:

^a Start date for tap monitoring in systems of more than 50,000 consumers.

^b Maximum Contaminant Level (MCL), MCL + Goal (MCLG) for atrazine to be reconsidered.

^c Dates mandated by district court

^d Assumes regulation in effect three years after final promulgation.

^e Program required as part of 1996 amendment.

^f For Public Water Systems (PWS) serving more than 10,000 consumers

^g Effective January 2004 for PWS serving more than 10,000 consumers.

^h MCL for atrazine to be revisited.

ⁱ Tiered monitoring approach pending availability of analytical methods.

State Regulations

The State of California retains primacy for enforcement of drinking water regulations. In this role, the state must adopt regulations equal to or more stringent than federal regulations. For the most part, state regulations are equal to federal regulations with the following exceptions:

- ❖ Cryptosporidium Action Plan - The State set more stringent standards for the recycle of filter backwash and other recycle streams.
- ❖ California IESWTR - The State has increased the required level of monitoring for filters and may require additional inspections, monitoring and reporting.
- ❖ Source Water Assessment Program - The State has structured its SWAP to allow water utilities to conduct their own assessments to help improve and preserve water quality of the public water supply sources.

Water Age

An extended period simulation water age analysis has been performed on the existing distribution and storage system under average day demands. The WTP is not detailed in the hydraulic model so water coming from the clearwell is considered “new” water (i.e., zero hours old). The hydraulic model water age analysis then calculates the age of the water after leaving the WTP (clearwell).

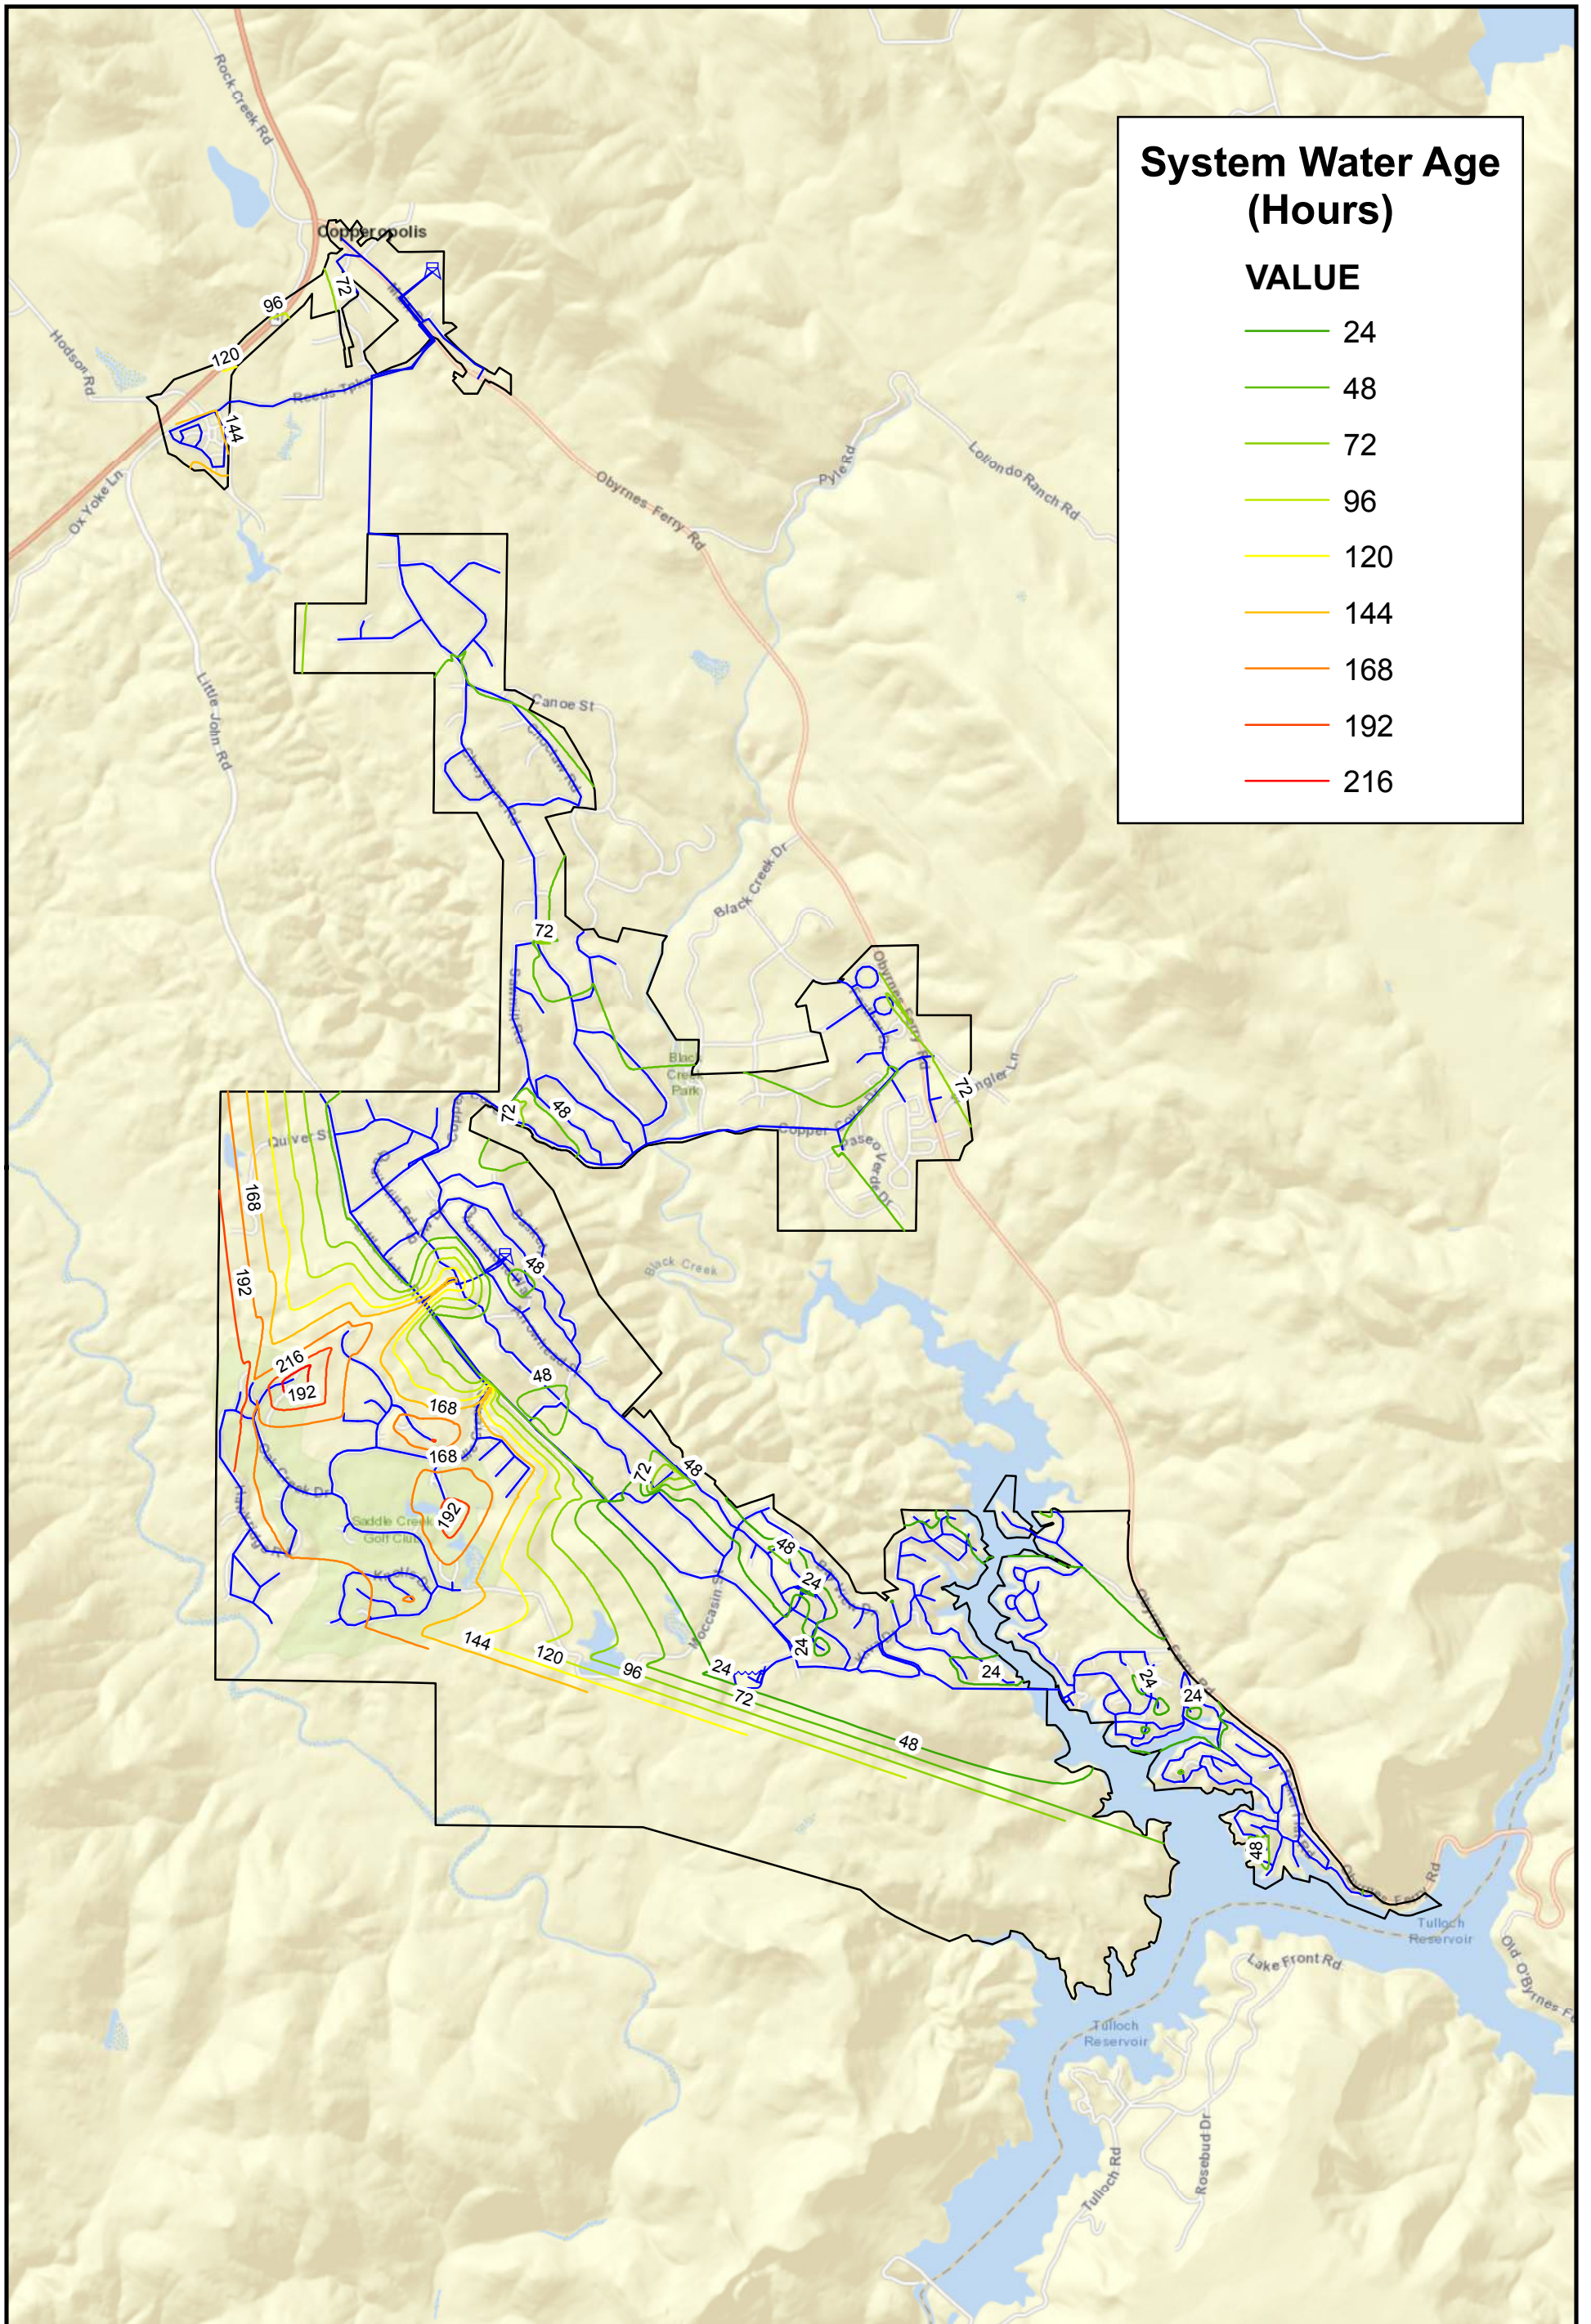

Based on the analysis, water is oldest in the Copperopolis Zone and Zone C3 (Saddle Creek). Figure 5 shows the range of values of water age, in hours, throughout the distribution system.

Disinfection By-Products

Trihalomethane (TTHM) and haloacetic acids (HAA5) monitoring and compliance is required under the Federal Environmental Protection Agency (EPA) regulations for systems with service populations of 500 to 9,999 that use treated surface water supplies. CCWD has not had a single violation in regards to either disinfection by-product over the last 10-years. Figure 4 below summarizes the disinfection by-product records presented in CCWD’s Consumer Confidence Reports between 2007 and 2017.

System Evaluation

Evaluation Criteria

The Copper Cove water system will be evaluated for its ability to meet existing and future water demands and to comply with the District's Design and Construction Standards. Two different scenarios will be analyzed as part of the 2018 WMP:

1. Existing System
2. Future System at Buildout

The system will be divided into five categories for this evaluation: water supply, water treatment, storage, pumping, and piping. The district provided a system-wide hydraulic model that was updated in 2013 to analyze the system's distribution facilities, including storage, pumping, and piping. The system model has been updated to capture new demand criteria and any new or replacement water mains installed since the last model update. A comprehensive list of model programming is included as Appendix B.

A summary of the system evaluation planning criteria is presented on the following page.

System Model Criteria:

- Existing Demand (ADD) = 1.58-mgd
- Buildout Demand (ADD) = 5.35-mgd
- Existing ADD:MDD Peaking Factor = 1.70
- Buildout ADD:MDD Peaking Factor = 2.22
- MDD:PHD Peaking Factor = 1.5

Water Treatment Design Criteria¹:

- Treatment Plant Capacity: Hydraulic and treatment capacity sized to meet MDD.

Water Storage Design Criteria¹:

- Storage tank sizing shall be equal to the sum of the following three components:
 - Fire Storage Reservation: A minimum of four hours times the appropriate fire flow demand.
 - System Peaking Storage: Equal to 20 percent of the maximum day flow.
 - Emergency Storage: Equal to four hours of the MDD.
- Fire Storage may be supplemented by pumps.

Water Pumping Criteria¹:

- Pump stations shall be able to deliver the MDD with the largest pump out of service. Peak hour demands and fire flows are expected to be supplied by storage without additional pumping. If the uphill zone does not have adequate storage for fire flow, the booster pump station should have the ability to deliver the fire flow to the higher zone.

¹ Calaveras County Water District Construction and Design Standards, June 2009.

Existing System Piping System Design Criteria¹:

- Transmission Lines: Hydraulic capacity sized to pass PHD at a maximum velocity of five feet per second (ft/s) and/or MDD plus fire demand, while maintaining 20 psi residual pressure in the system.
- Hazen Williams “C” Factor: Pipes shall use a “C” factor of 130 for new pipe and 110 for existing pipe.
- Fire Flow Requirements³: A maximum velocity of 12 ft/s shall apply to fire flow conditions and the minimum velocity shall be two ft/s. The existing District minimum fire flow requirements are listed in Table 12.
- System Pressure:
 - System shall maintain a minimum pressure of 40-psi under PHD.
 - System shall maintain a maximum pressure of 120-psi under static conditions for distribution mains.

Fire Flow Design Criteria²:

- Required Fire Flow:
 - Residential Districts and Individual Dwellings < 3,600-sf = 1,000-gpm
 - Commercial Districts and Individual Dwellings > 3,600-sf = 1,500-gpm
 - Undeveloped Commercial Districts = 1,500-gpm

Raw Water Supply

The existing water rights have been evaluated for their ability to supply existing and projected demand.

The current water rights provide up to 6,000 AF/yr and can support substantial growth before they will need to be expanded. The total raw water demand is 2,172 AF/yr based on the combined irrigation and Copper Cove system demands. The Copper Cove system demand is 1,770 AF/yr based on the existing ADD of Copper Cove. The Saddle Creek Golf Course is the only irrigation water user and uses approximately 400 AF/yr of raw water.

The water rights will need to be expanded to meet the combined raw water demand at buildout. The annual raw water demand will be approximately 13,615 AF/yr at buildout based on the existing commercial raw water demand and the buildout average daily demand. The raw water rights will need to be expanded before the raw water demand reaches 90 percent of the current raw water rights (5,400 AF/yr). The raw water demand is expected to reach 5,400 AF/yr when the number of connections reaches 3,775. Based on the growth rates previously presented, this will occur in year 2083. The raw water rights will need to be expanded by 8,215 AF/yr to support the Copper Cove buildout system demand. Raw water rights will need to be further increased to support any additional commercial raw water demands.

The raw water pump station and pipeline can convey up to 4.75-mgd. The pump station and the transmission main to the WTP can support conveyance of both the existing commercial raw water demands and existing system demands. The golf course only uses water half the year including summer peak demand periods. The capacity of the pump station less the allocated golf course demand is 3.75-mgd.

¹Calaveras County Water District Construction and Design Standards, June 2009.

² Calaveras Fire Building Requirements, April 2010

The pump station and pipeline capacity will need to be expanded to support future raw water demands. Plans to expand the raw water intake and pump station are recommended when the MDD plus irrigation demand becomes 90 percent of the raw water pumping capacity available (4.3-mgd). Based on the DOF growth rates (Table 12), the MDD is expected to reach 4.3-mgd when the number of connections reaches 3,300 or in 2056 as long as the golf course remains the only irrigation water demand. The raw water intake, pump station and transmission main will need to be reconsidered if the District decides to sell any additional raw water to new commercial customers.

The existing raw water pumps are sufficient to meet the existing demand. As note in the background, the District plans to relocate one of the raw water pumps to improve influent water quality conditions and repair the existing spare pump. No further improvements are recommended to the raw water pump station at this time.

Water Treatment

The Copper Cove WTP has not been upgraded since it was originally constructed in 1998. The existing facilities have been evaluated for their ability to support existing and future demand and remaining useful life.

The current WTP facilities are rated for 4-mgd. The existing MDD is approximately 2.7-mgd. The MDD projected at buildout is approximately 11.9-mgd.

Plans to expand the WTP should begin when the MDD becomes 90 percent of the WTP's treatment capacity (3.6-mgd). The MDD is expected to reach 3.6-mgd when the number of connections in the District is approximately 3,000. This is projected to occur in 2038 based on the DOF growth rates.

All of the existing WTP facilities are in good condition with the exception of the clearwell. The clearwell coating is failing, the interior is corroding and the roof is failing according to District Staff. The existing clearwell provides disinfection contact-time which is an irreplaceable component in the WTP process. The existing clearwell must be rehabilitated or replaced to allow the District to continue providing a safe and reliable drinking water supply to Copper Cove.

Treated Water Pumping Evaluation

Each booster pump station is required to have a firm capacity equal to the Zones MDD given that each zone is supported by at least one Tank. Firm capacity assumes the largest pump is out of service. The MDD for each pumping zone under existing and buildout conditions is presented in Table 18. The District provided a condition assessment of the existing pumps at each pump station. Current conditions are described in Table 19.

Table 18. Evaluation of Treated Water Pumping without Improvements.

Station	Description	Pump Number	Design Flow (gpm)	Firm Capacity (gpm)	Existing MDD (gpm)	Buildout MDD (gpm)
WTP Pump Station	Clearwell to B Tanks	1	2,600	2,600	1,866 ¹	8,326 ¹
		2	2,600			
B-C Pump Station	B Tanks to C Tanks	1	900	900	1,390 ²	4,709 ²
		2	450			
		3	450			

Station	Description	Pump Number	Design Flow (gpm)	Firm Capacity (gpm)	Existing MDD (gpm)	Buildout MDD (gpm)
Copperopolis Pump Station	Zone C5 to Copperopolis	1	90	90	78	461
		2	90			
¹ WTP Pump Station supports the demand of the entire system ² B-C Pump Station supports the demands of both the C Zones and Copperopolis						

Table 19. Condition Assessment of Existing Pumps per the District.

Pump Station	Existing Pump Conditions
WTP Pump Station	Satisfactory Condition
B-C Pump Station	Poor Condition
Copperopolis Pump Station	Poor Condition

The WTP pump station is in good condition and has no firm capacity deficiencies. The pump station has more than sufficient firm capacity to meet the existing system demands and sufficient firm capacity to support growth beyond the useful life of the existing pumps. Planning to expand the WTP pump station capacity should begin when the system demand reaches 90 percent of the pump station’s firm capacity (3.4-mgd). The system demand is expected to reach 3.4-mgd when the number of connections reaches 2,875. This is projected to occur in 2031.

The B-C Pump Station pumps are insufficient to meet the existing firm capacity required and create high-pressure deficiencies. The B-C Pump Station pumps water from the B Tanks to the C Tanks and distributes water to connections along Arrowhead Street. Due to the elevation difference between the B Tanks and C Tanks, the system pressure exceeds the 120-psi design limit at every connection south of the intersection between Flint Trail and Arrowhead Street. The B-C pump station should be improved or replaced entirely.

While the firm capacity supports existing MDD of Copperopolis, the District’s condition assessment reported that the pumps are in poor condition and recommended replacement. Furthermore, the immediate development planned to the south of Copperopolis Town Center will increase the MDD at the Copperopolis Pump Station from 78-gpm to 297-gpm when complete. For planning purposes, the Copperopolis Pump Station needs to support a minimum firm capacity of 300-gpm.

Treated Water Storage Evaluation

The treated water storage evaluation considers both the condition of the existing storage facilities and the storage capacity required by those facilities.

The tank zone capacity in each zone was compared to the required storage based on the water storage design criteria. Evaluations are presented for baseline demands and buildout demands in Table 20 and Table 21 respectively. The available storage exceeds the storage required for the existing conditions in all tank zones but is insufficient to support the buildout demands.

Table 20. Evaluation of Available Storage Capacity under Existing Demand Scenario.

Criteria	B Tank Zone	C Tank Zone	Copperopolis Tank Zone
Total Storage Capacity (gallons)	1,050,000	1,086,000	500,000
Highest FF requirement in zone (gpm)	1,500	1,500	1,500
Required FF storage (gallons)	360,000	144,000 ²	338,000 ²
Existing Tank Zone MDD (gallons)	685,000	1,890,000	112,000
Required emergency storage (gallons)	114,000	315,000	19,000
Required operational storage (gallons)	137,000	378,000	22,000
Total required storage (gallons) ¹	611,000	837,000	379,000
Storage deficit (gallons)	-	-	-
¹ Total Required Storage = Required FF storage (4 hours) + Emergency storage (4 hours of MDD) + Operational storage (20 percent of MDD). ² The required FF for the C Tank and Copperopolis Tank Zone is supplemented by the existing pump capacity.			

Table 21. Evaluation of Available Storage Capacity at Buildout without Improvements.

Criteria	B Tank Zone	C Tank Zone	Copperopolis Tank Zone
Total Storage Capacity (gallons)	1,050,000	1,086,000	500,000
Highest FF requirement in zone (gpm)	1,500	1,500	1,500
Required FF storage (gallons)	360,000	144,000	338,000
Buildout Tank Zone MDD (gallons)	4,365,000	6,961,000	664,000
Required emergency storage (gallons)	727,000	1,160,000	111,000
Required operational storage (gallons)	873,000	1,392,000	133,000
Total required storage (gallons)	1,960,000	2,696,000	582,000
Storage deficit (gallons)	910,000	1,610,000	82,000
Note: Total Required Storage = Required FF storage (4 hours) + Emergency storage (4 hours of MDD) + Operational storage (20 percent of MDD).			

A summary of existing tank conditions is provided in Table 22. The steel tanks were assessed by Aqua-Tech Co. in 2012 and B Tank #1 has been assessed based on feedback from operations staff. B Tanks #1 and #2 are no longer in acceptable condition. B Tank #1 is nearly 50-years old, is a redwood tank, and is leaking at this time. Figure 6 presents the B Tank #1 condition and visible leaks. B Tank needs to be replaced immediately.

B Tank #2 has deteriorated significantly and was recommend by Aqua-Tech Co. to be taken out of service for rehabilitation as soon as possible. At minimum, B Tank #2 needs the existing roof and rafters to be replaced and recoating of the interior and exterior surfaces according to Aqua-Tech Co.'s recommendation.

Table 22. Condition Assessment of Existing Tanks.

Tank	Material	Tank Condition
B Tank #1	Redwood	Unacceptable Condition
B Tank #2	Steel	Unacceptable Condition
C Tank #1	Steel	Satisfactory Condition
C Tank #2	Steel	Satisfactory Condition
Copperopolis Tank	Steel	Satisfactory Condition, Lacks Redundancy

Figure 6. Condition of B Tank #1

B Tank #1 should be replaced with a new welded steel tank sized to support the projected future storage requirement at the end of a 50-year service life. The B Zone system demand is projected to be 925,000-gallon in 2070. B Tank #1 will need to provide at least 175,000 to supplement the existing capacity of B Tank #2.

The District should also consider constructing a second tank at the Copperopolis tank site to support future maintenance of the Copperopolis tank. The Copperopolis tank was constructed in 2008 and will be due for recoating maintenance within the next 15 years. The Copperopolis tank cannot to be taken out of service for maintenance unless a second or temporary tank is installed.

Treated Water Distribution Evaluation

The InfoWater hydraulic model was used to evaluate the existing distribution system. Several model scenarios were developed to identify low system pressure areas, high system pressure areas and available fire flow.

Low System Pressure Areas

Areas of low system pressure were identified using the hydraulic model PHD scenario. Nodes throughout the model were screened to determine if the pressure under PHD fell below the 40-psi minimum system pressure design criteria. Nodes where the pressure is less than 40-psi under PHD demand conditions but maintain adequate pressure under static conditions were labeled in the model as low system pressure.

Under PHD, several areas do not maintain the minimum pressure. Low-pressure areas were identified in Zones B1, C1 and C5. Zones B1 and C1 are directly served by tanks and Zone C5 is served by PRVs. The areas identified as low pressure are presented in Figure 8. Nodes where low system pressure was the result of insufficient static head were omitted from Figure 8.

High System Pressure Areas

Areas of high system pressure were identified using the existing ADD scenario. Nodes in the hydraulic model were used to identify areas where the system pressure exceeds the District's 120-psi maximum pressure criteria. Some high-pressure areas cannot be avoided due to the ranging elevations within individual pressure zones. Zones C1, C3 (Saddle Creek) and C4 have the highest susceptibility to high pressure due to pockets of low elevations along pipe mains. Figure 9 presents a map of the areas under high pressure.

High Velocity Pipelines

High velocity pipelines were identified using the existing PHD scenario. Pipelines conveying water at a rate exceeding 5 feet per second do not comply with the current District standard and were flagged. The transmission main conveying water from the B Tanks to the C Tanks and the distribution/transmission main connecting C Tanks to Zones C1, C2, C4 and C5 were both identified as deficient based on the PHD model scenario. Figure 10 presents a map of the pipeline deficiencies.

The transmission main along Arrowhead street conveys water from B-C Pump Station to C Tanks. The maximum flow through this main is limited to the output of the pump station. When the pump station operates at full capacity (1800-gpm) a pipeline velocity of 7.3 feet per second will result under existing conditions.

The distribution/transmission main along Arrowhead Street and Copper Cove Drive connects C Tanks to Zones C1, C2, C4 and C5. Under existing PHD demand conditions the velocity of the distribution main segment along Arrowhead Drive was found to range between 5.1 and 6.4 feet per second. The transmission main segment along Copper Cove Drive was found to be 5.4 feet per second.

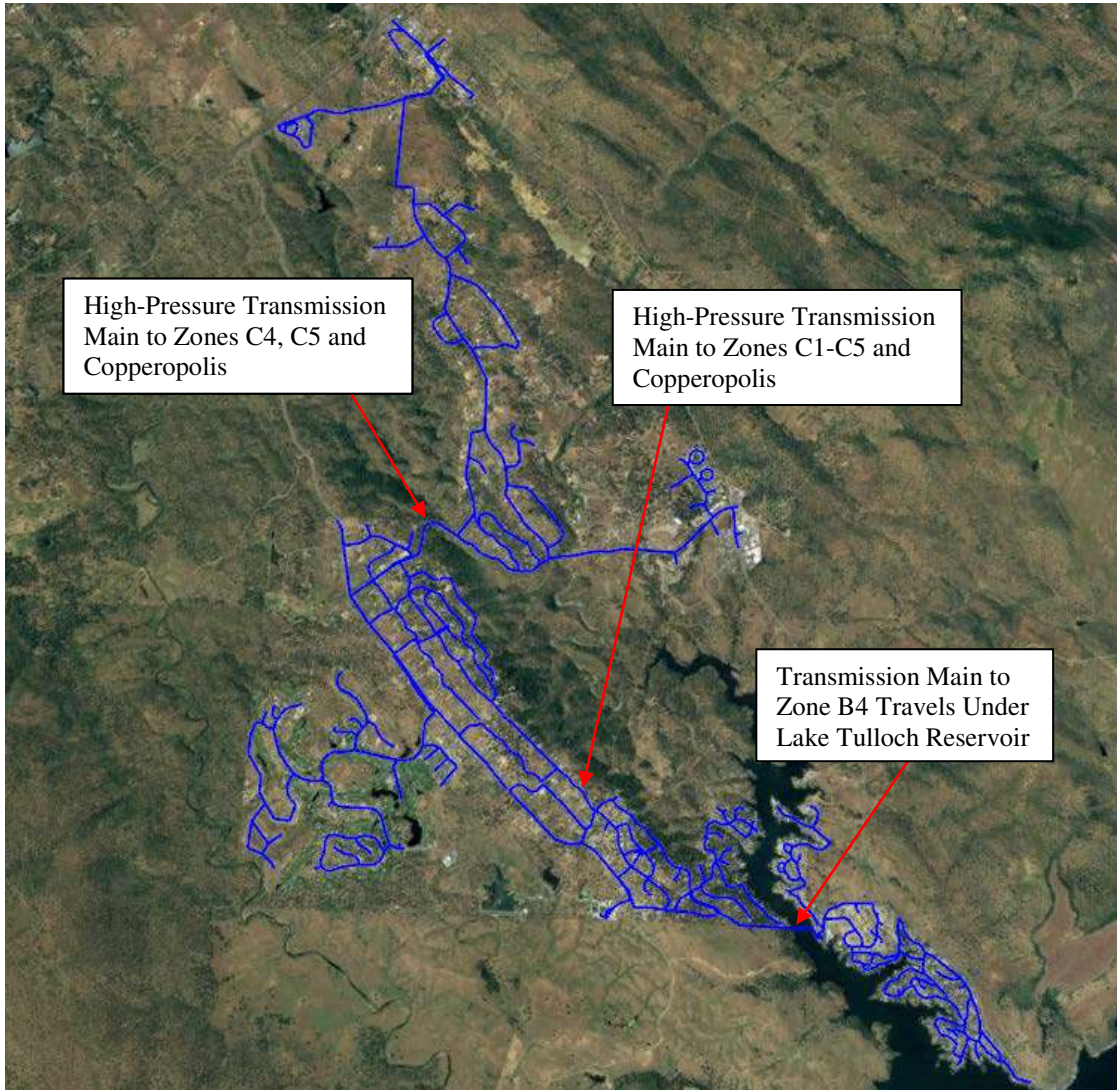

Fire Flow Deficiencies

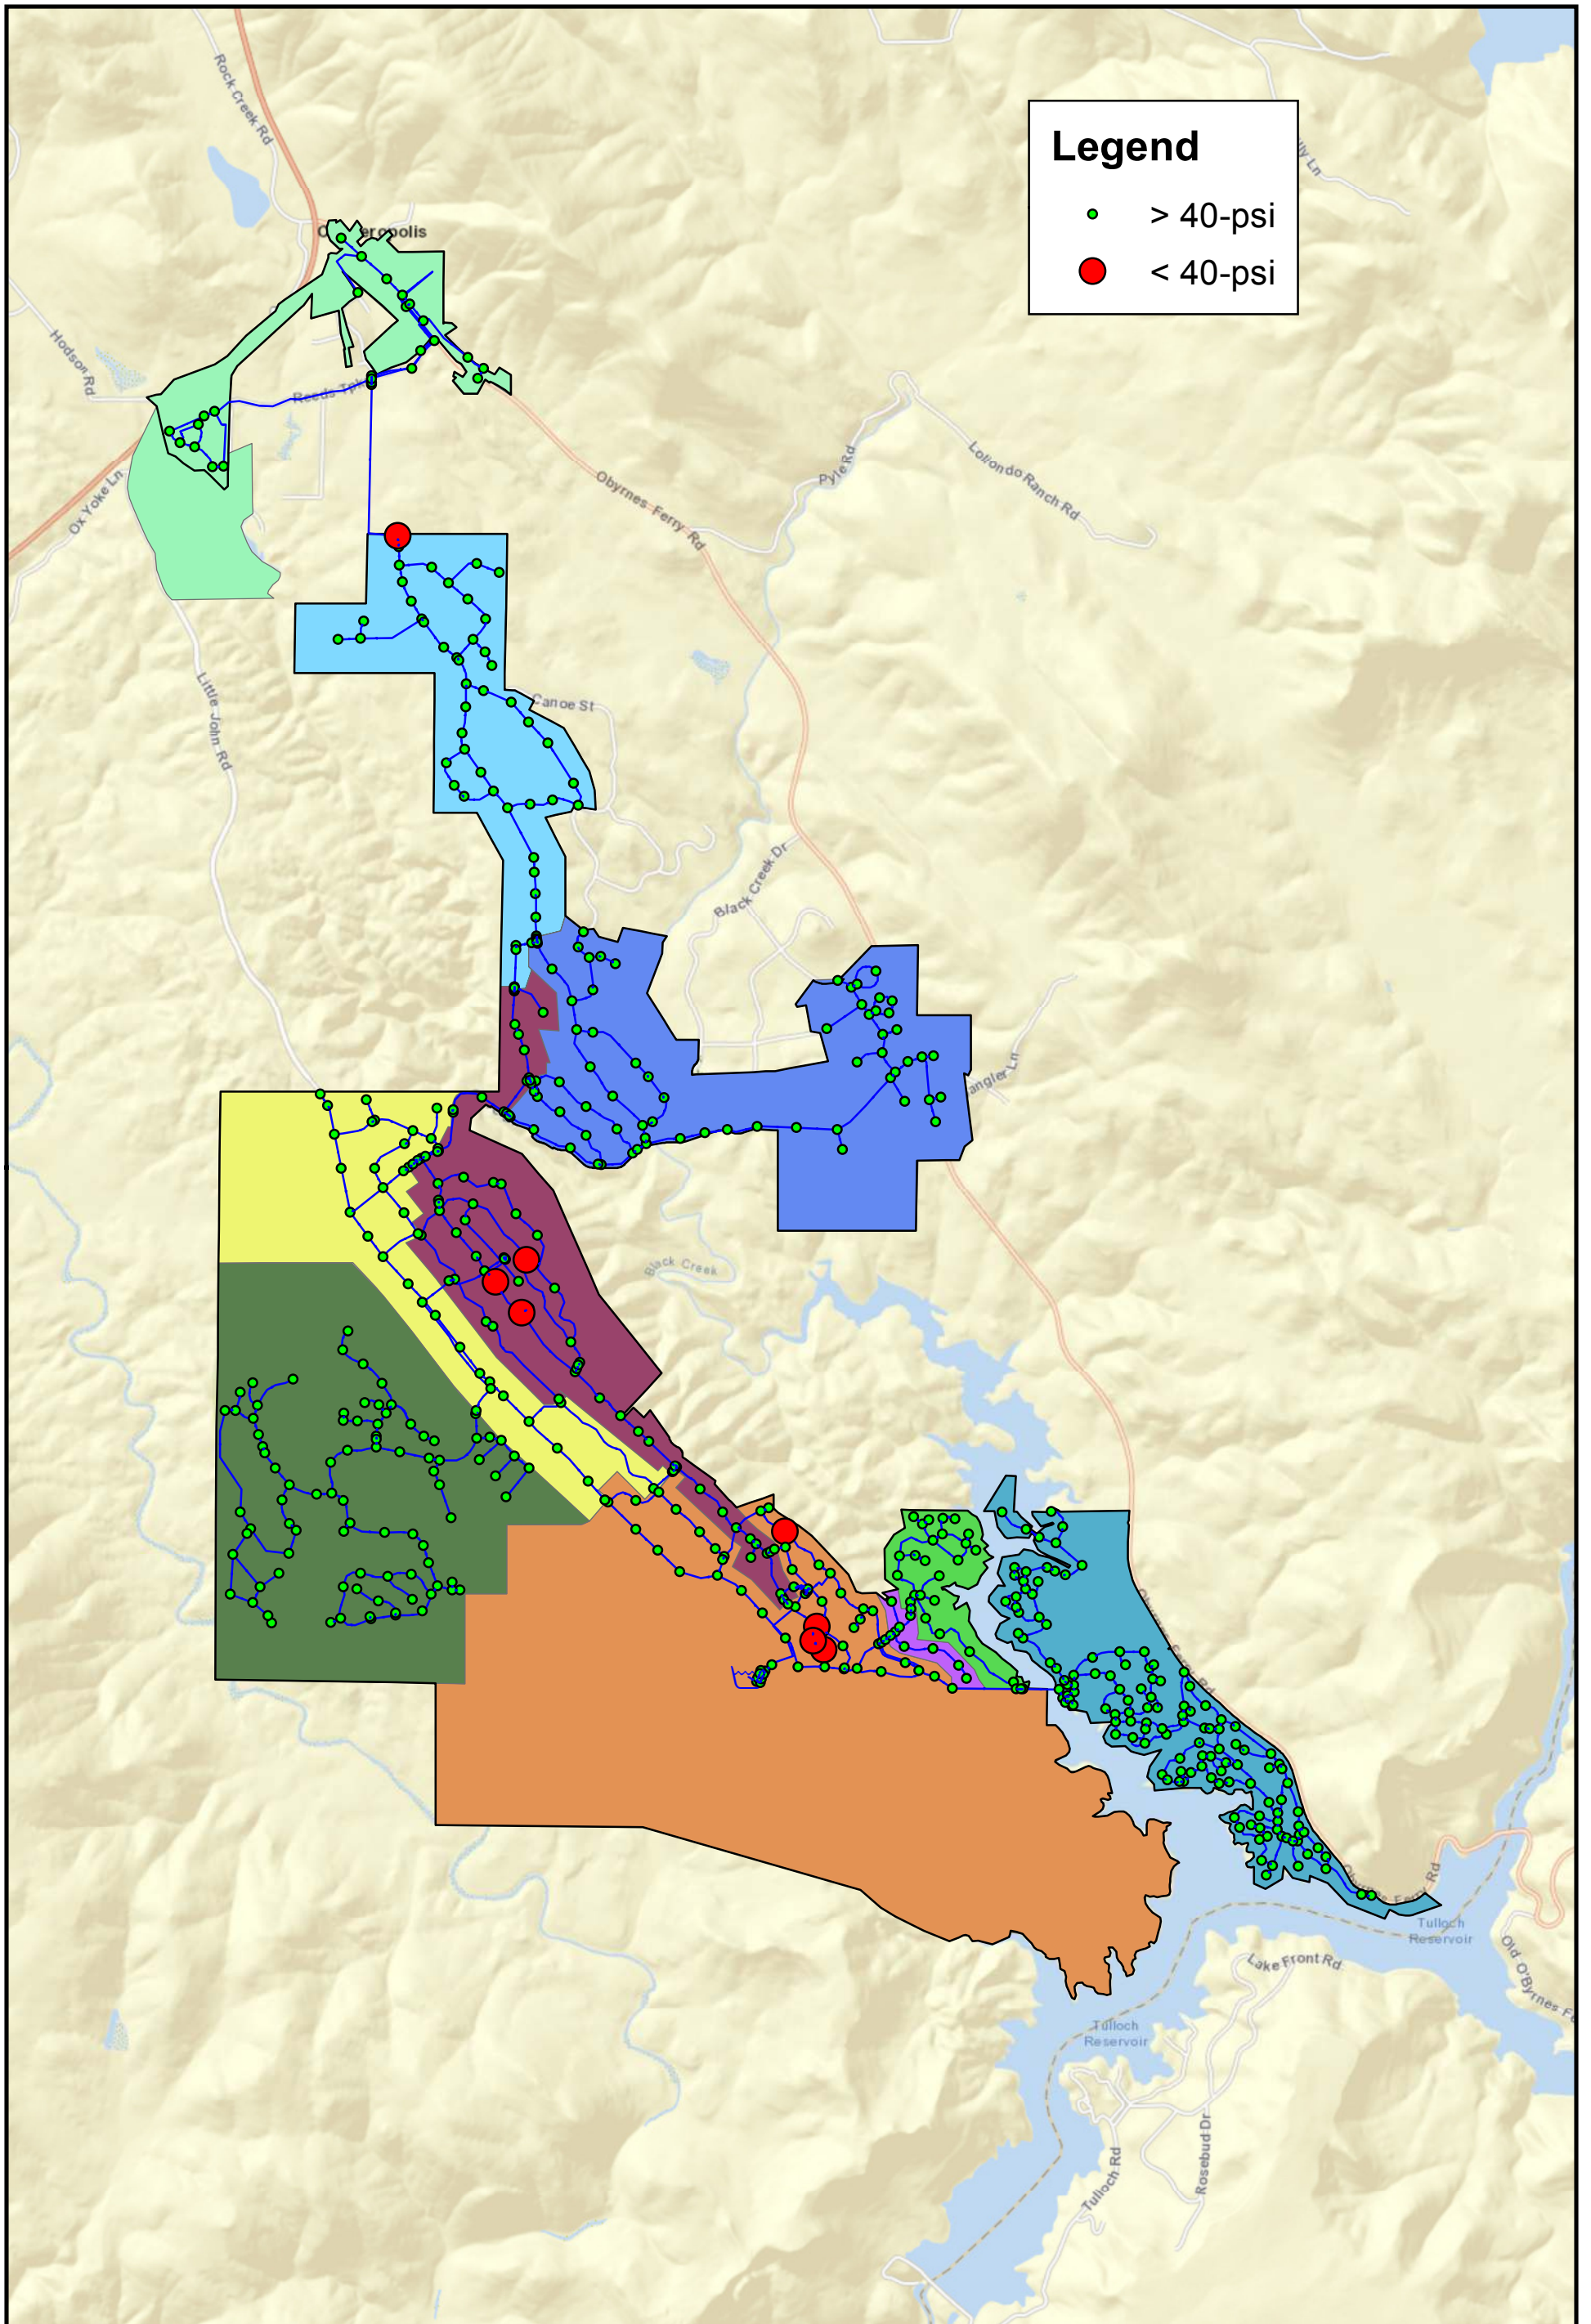

The model was used to calculate the available MDD plus fire flow for the baseline conditions. Nodes throughout the system were programmed to support either a 1,000-gpm fire flow, or a 1,500-gpm fire flow depending on the user type. All nodes within 300 feet of medium residential, commercial, or community center parcels were assigned a 1,500-gpm fire flow. All other nodes were assigned 1,000-gpm. Approximately one-third of the nodes throughout the district were found to be deficient. The greatest deficiencies were found in Zones C5 and Copperopolis where fire flows less than 500-gpm were realized, these deficiencies are presented in Figure 11.

High Risk Zones

Zone B4, Zones C1-C5, and Copperopolis are all at risk due to extended outages caused by transmission main failure (see Figure 7). Zones C1-C5 and Copperopolis are served by a single high-pressure connected to C Tanks along Arrowhead Street. Zones C4, C5, and Copperopolis are served also by a second single high-pressure transmission main along Copper Cove Drive. The high-pressure increases the potential for failure and increases the difficulty of field repairs. Similarly, Zone B4 is served by a single transmission main that crosses beneath the Lake Tulloch Reservoir. An extended outage would be unavoidable if this main were to fail within the reservoir as District field staff would be unable to perform the necessary repairs within the reservoir. It is recommended that the District construct new pipelines to loop these isolated areas to provide a redundant water service and prevent extended system outages in the event of transmission main failures.

2018 COPPER COVE WATER MASTER PLAN

**High Velocity Pipes
Existing PHD**

FIGURE
10

Legend

- Less than 500 gpm
- 500 ~ 750 gpm
- 750 ~ 1,000 gpm
- 1,000 ~ 1,250 gpm
- 1,250 ~ 1,500 gpm
- Greater than 1,500

Recommended Improvements

Based on the system evaluation, the District will need to address a number of existing and near-future system deficiencies to comply with current district standards. The following projects have been identified:

- WTP Clearwell Improvements
- B Tank #1 Replacement
- B Tank #2 Rehabilitation
- C1 and Saddle Creek Transmission Main Project
- Copperopolis Pump Station Improvements
- B4 Loop Main Project
- C4 Loop Main Project
- Annual Pipe Replacement Program
- Annual Infrastructure Repair and Replacement Program

The District will need to replace existing tanks, pumps and pipelines throughout the Coper Cove Water System. For the study area to achieve a sustainable treated water supply and to be assured fire protection meets fire flow requirements, the recommended projects listed above must be in place in the immediate future. Improvements to the raw water rights, raw water pump station, WTP and WTP pump station can all be delayed until the system demand reaches their respective demand trigger (90 percent of the associated capacity). Table summarizes the projections of future improvements beyond the planning horizon of this WMP. The demand triggers are in terms of equivalent number of connections and the projected year based on the growth rates.

Table 23. Future Improvement Triggers

Future Improvement	Existing Capacity	Demand Trigger	Equivalent No. of Connections	Projected Year
Raw Water Rights	6,000-AF	5,400-AF	4,000	2083
Raw Water Pump Station	4.75-mgd	4.30-mgd	3,300	2056
Water Treatment Plant	4.00-mgd	3.60-mgd	3,000	2038
WTP Pump Station	3.75-mgd	3.40-mgd	2,875	2031

WTP Clearwell Improvements

The system evaluation identified an immediate need to rehabilitate and/or replace the existing clearwell. The clearwell is a critical WTP process and the WTP cannot be operated without it. The District can either install temporary facilities to supplement the existing clearwell and facilitate rehabilitation of the existing clearwell or construct a new clearwell. Installing a new clearwell would replace the existing clearwell and allow the District to either rehabilitate or abandon the existing clearwell.

Rehabilitation of the existing clearwell is recommended in lieu of installing a new clearwell. Efforts to install a new/secondary clearwell would be better spent at a later date when the WTP requires a capacity expansion. The existing capacity is projected to be sufficient until the District reaches 3,000 connections (projected to occur in 2033). Recoating and repairing the existing clearwell will allow the District to utilize the clearwell's remaining useful life.

B Tank #1 Replacement

The system evaluation identified that B Tank #1 is in an unacceptable condition and needs immediate replacement. B Tank #1 is one of two tanks necessary to meet the system storage requirement. The redwood of B Tank #1 has deteriorated to the point where water is leaking through the walls and could fail. B Tank #1 needs be replaced with a tank with a capacity of at least 175,000-gallon; however, a 500,000-gallon tank is recommended. A 500,000-gallon tank will exceed the emergency and operational storage volume required to allow operations staff to take B Tank #2 offline.

B Tank #2 Rehabilitation

The system evaluation identified an immediate need to rehabilitate B Tank #2. Like B Tank #1, B Tank #2 is critical to maintaining the storage capacity requirement. B Tank #2 in an unacceptable condition; the interior and exterior tank coating has worn away allowing the underlying steel to rust. The rafters supporting the roof have deteriorated to the point where it is no longer safe for personnel to walk on the tank. Rehabilitation efforts, at minimum, include replacing the rafters and roof and recoating the interior and exterior of the tank.

C1 and Saddle Creek Transmission Main Project

The C1 and Saddle Creek Transmission Main Project is recommended to address multiple distribution system deficiencies and reduce system pumping requirements identified in the system evaluation. The project consists of constructing a new transmission main to convey water to Saddle Creek and Zone C1 (C Tank); constructing a new 1,900-gpm pump station and decommissioning existing B-C Pump station; and installing new PRV at the Flint Trail and Arrowhead Street intersection.. The C1 and Saddle Creek Transmission Main Project is presented in Figure 12. The project addresses and resolves multiple system deficiencies identified in the system evaluation:

- High-pressure deficiencies in Zone C1
- High-pressure deficiencies in Zone C3 (Saddle Creek)
- High-velocity deficiencies of the B Tank to C Tank Distribution Main
- B-C Pump Station Firm Capacity Deficiency

High pressure deficiencies in Zone C1 are addressed by decommissioning the B-C Pump Station and installing a new PRV at the intersection of Flint Trail and Arrowhead Street.

The project will also relieve Zone C3 high-pressure deficiency while reducing the system pumping requirements . The majority of the time Saddle Creek does not require the head provided by the C Tanks and is better served from B Tanks. Serving Saddle Creek via the WTP will relieve the high-pressure deficiency along Quail Creek Drive between B Tanks and C Tanks. PRVs would otherwise need to be installed along Quail Creek Drive to address the high system pressure deficiencies.

High-velocity deficiencies in the distribution main along Quail Creek Drive will also be addressed. Directly distributing water to C Tanks via the new pipeline will reduce the velocity in the in the main along Quail Creek and eliminate the need to improve the distribution man.

The C Tank Pump Station firm capacity deficiency will be resolved by installing three new 950-gpm pumps designed to support the projected system demand through the next 30-years. The

project will also reduce the water age in the system by nearly 24-hours by bypassing the B Tanks and distributing water directly to Saddle Creek and C Tank.

B4 Backup Main Project

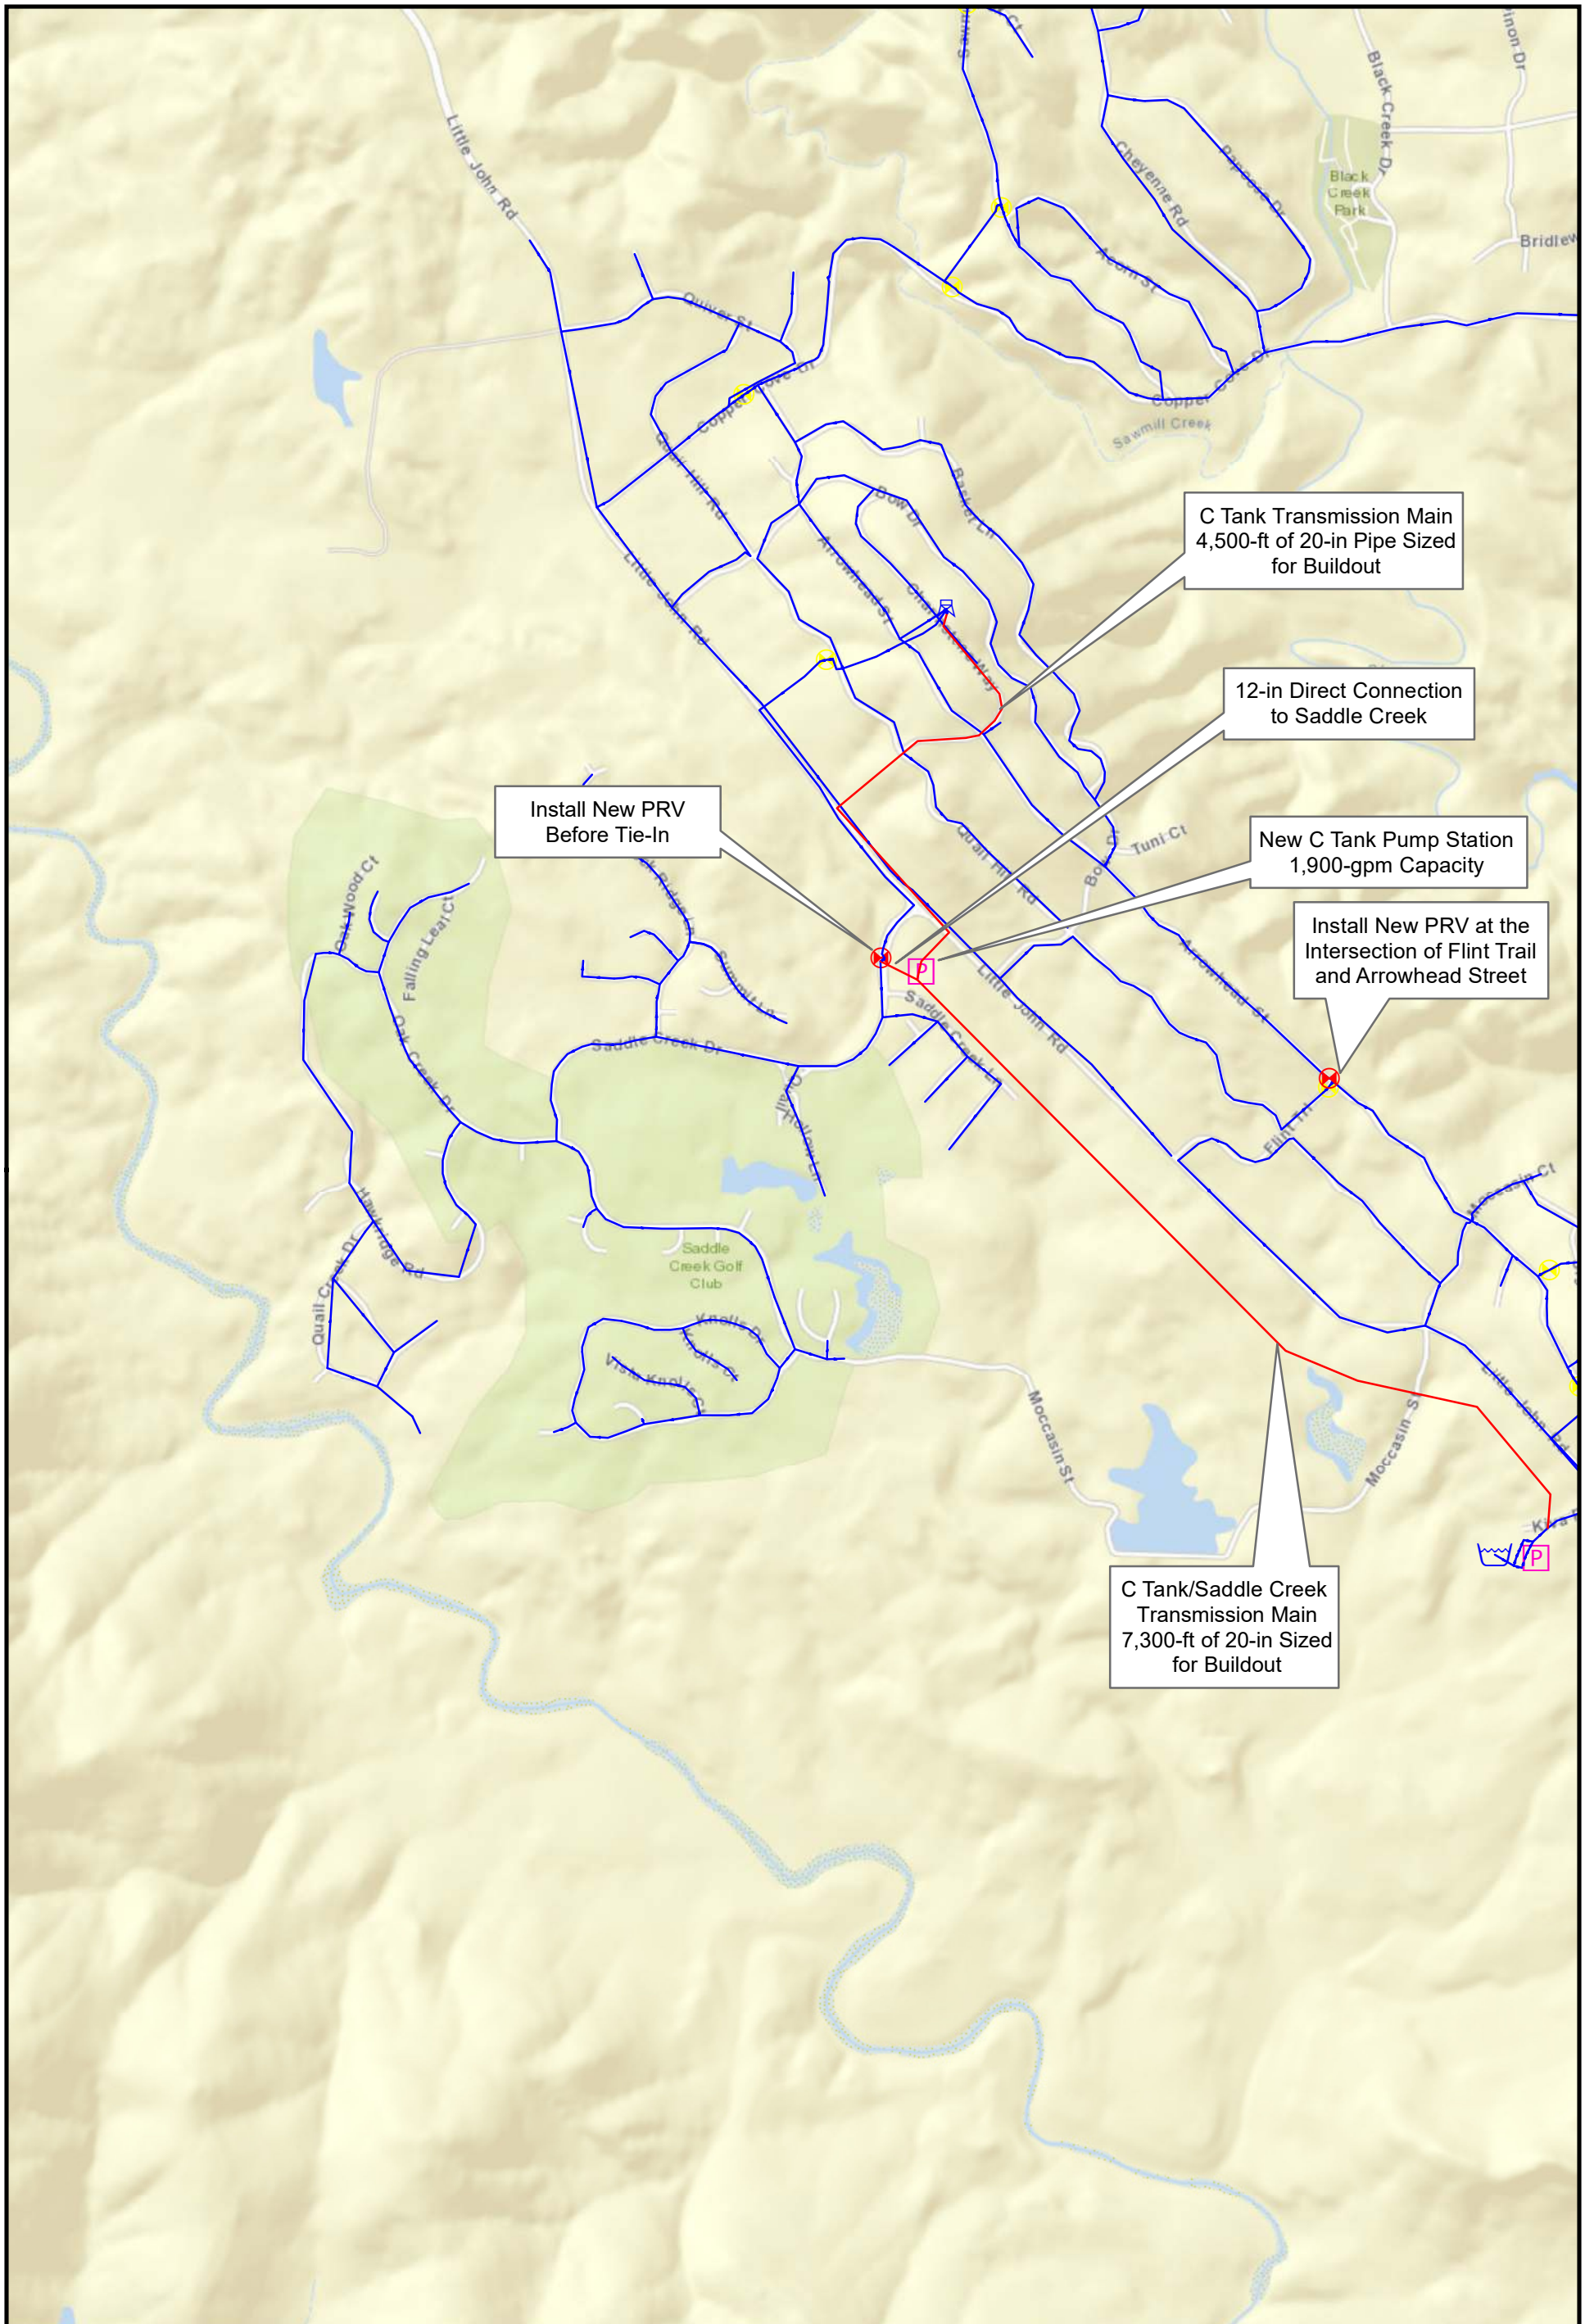

The B4 Backup Main Project is recommended to provide a redundant water source to Zone B4. The redundant water supply eliminates the risk of an extended outage if the transmission main supplying B4 fails within the segment under Lake Tulloch Reservoir. The Project consists of constructing a second 1,000-ft 12-in pipeline crossing under Lake Tulloch Reservoir.

C4 Loop Main Project

The C4 Loop Main Project is recommended to loop Zones B1 and C4. The loop provides a redundant water source and will eliminate fire flow deficiencies in Zone C4. The redundant water supply eliminates the risk of an extended outage if the high-pressure transmission main supplying C4 fails. The Project consists of constructing approximately 8,500-feet of 12-inch pipe parallel to the District's existing force main and installing a PRV. The proposed pipeline alignment is presented in Figure 13.

Copperopolis Pump Station Project

The Copperopolis Pump Station Project is recommended to replace the existing pumps and upsize the pump station capacity. The improved pump station is recommended to provide sufficient capacity to address near future developments discussed in the system evaluation and address the poor condition of existing pumps. Three 150-gpm pumps are recommended to provide a firm capacity of 300-gpm. The pump station will also help offset fire flow deficiencies in Copperopolis Zone.

Install New PRV Before Tie-In

C Tank Transmission Main
4,500-ft of 20-in Pipe Sized for Buildout

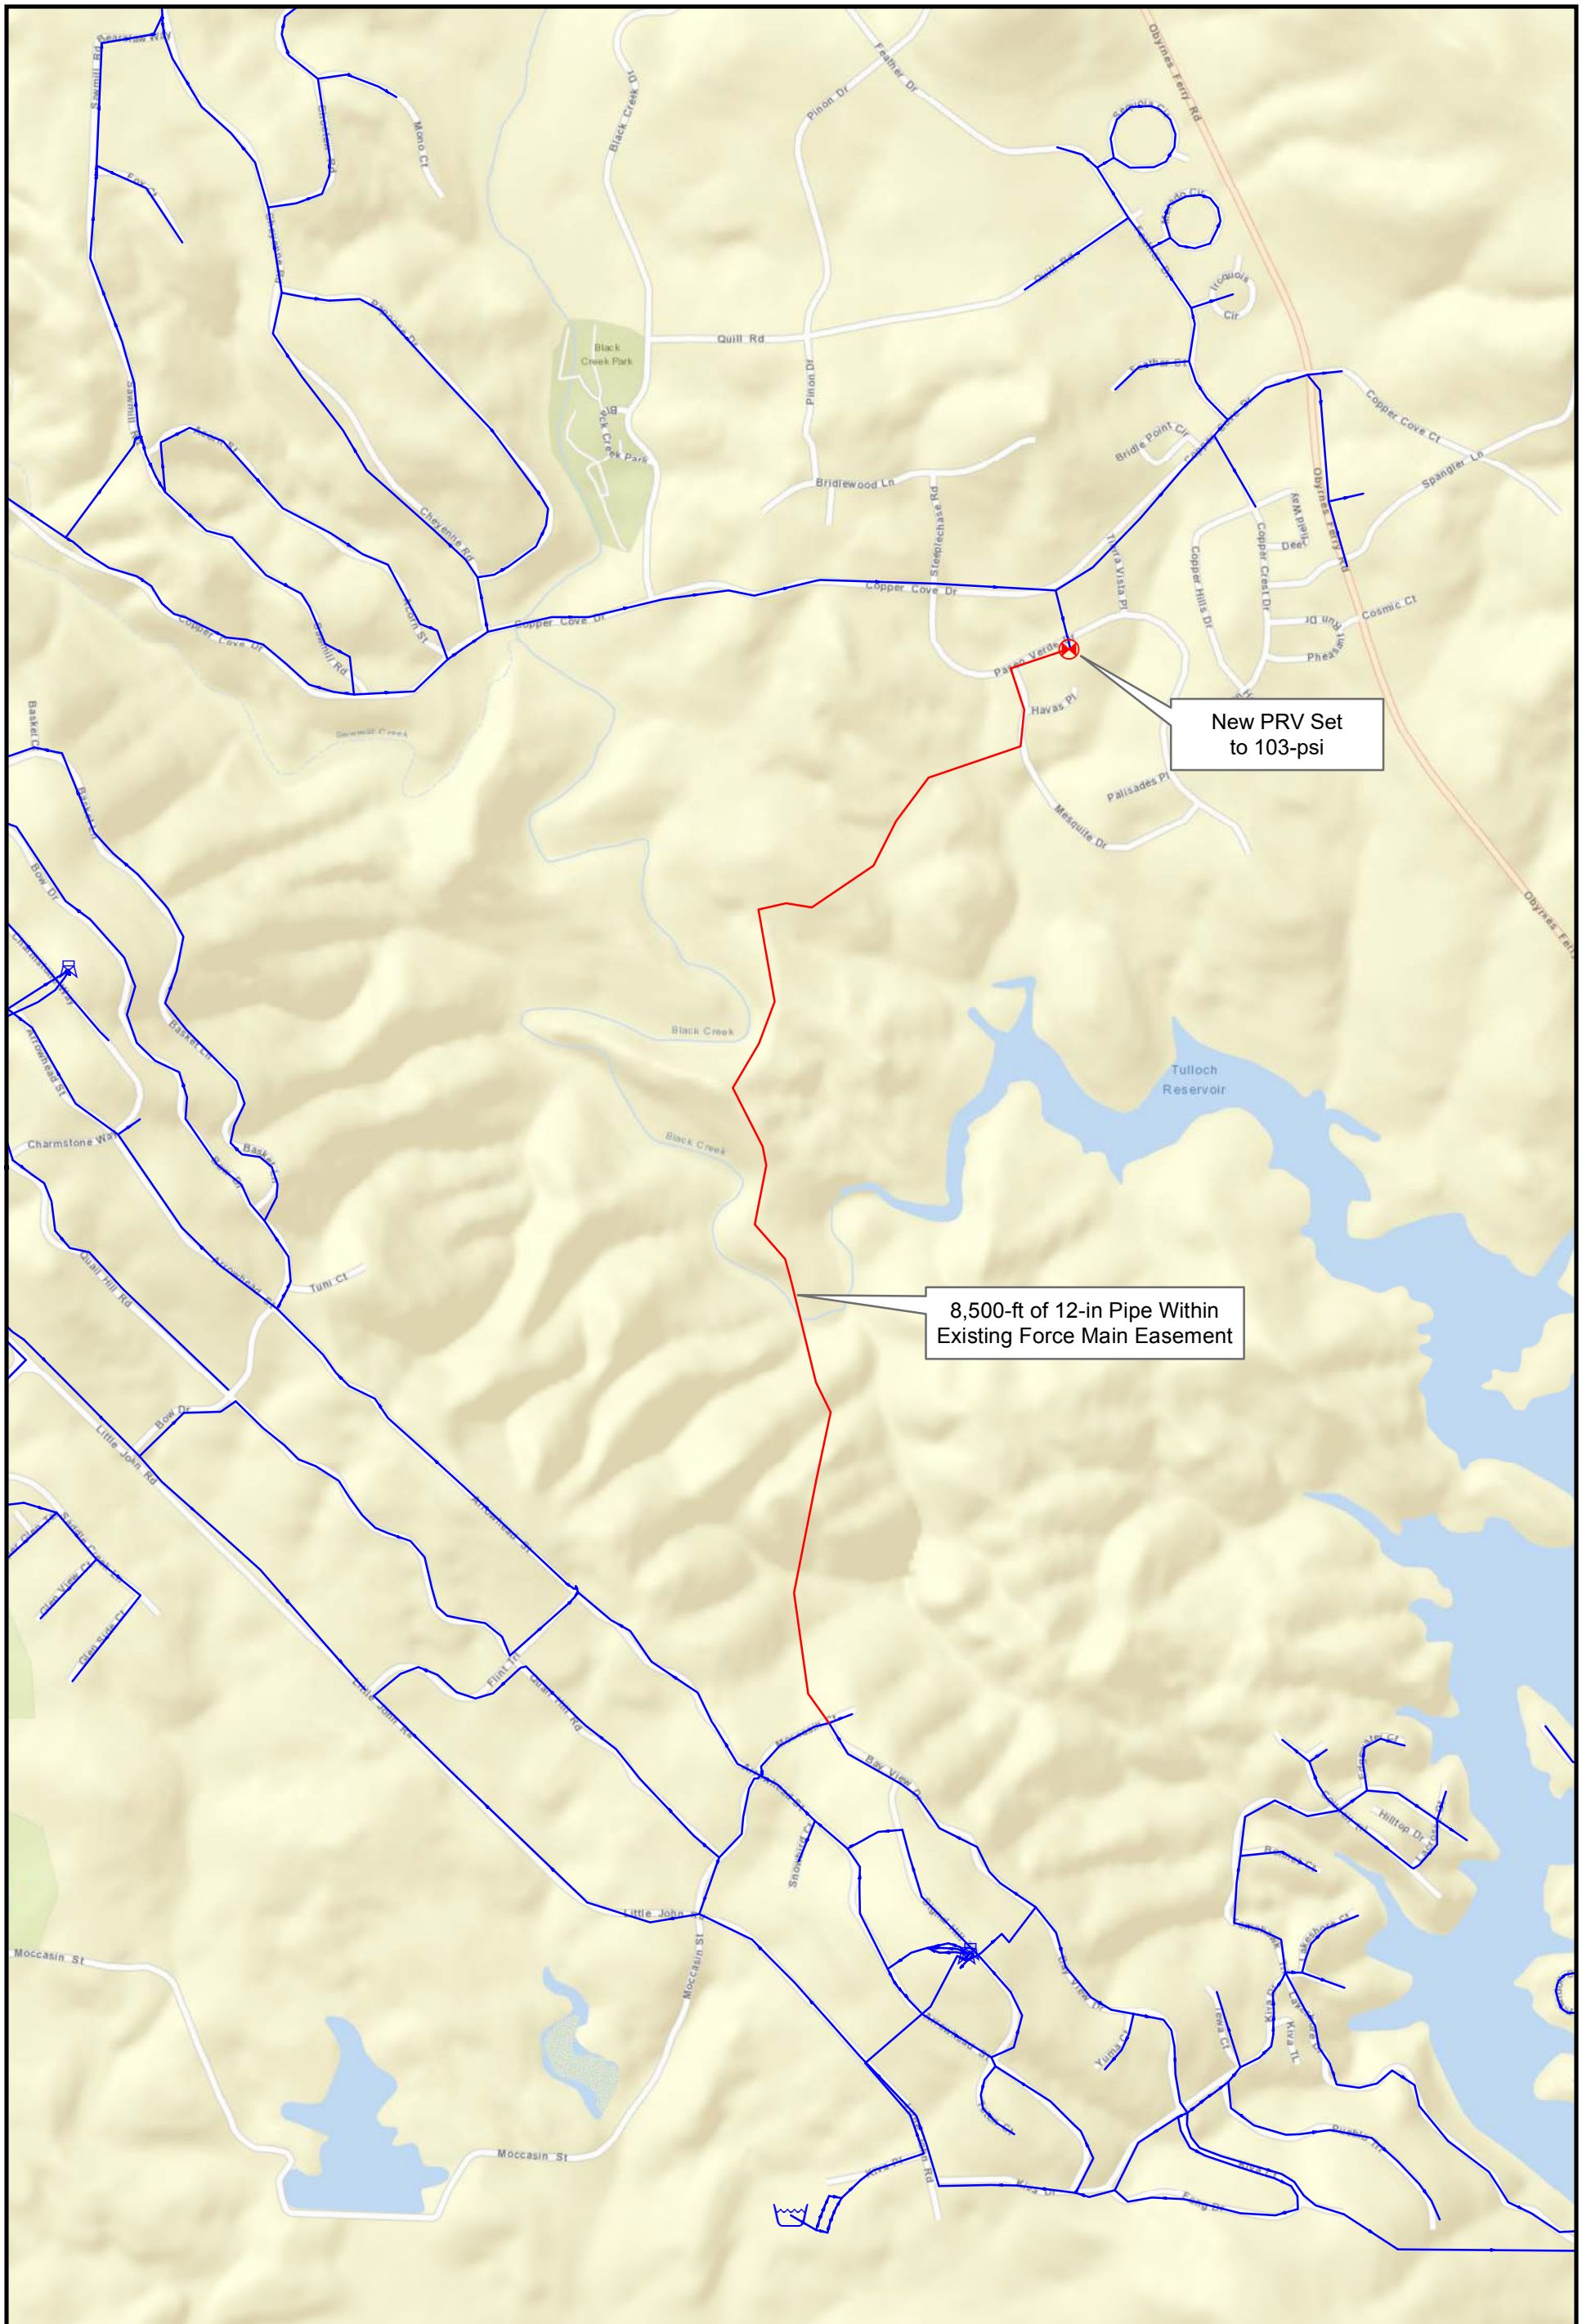

12-in Direct Connection to Saddle Creek

New C Tank Pump Station
1,900-gpm Capacity

Install New PRV at the Intersection of Flint Trail and Arrowhead Street

C Tank/Saddle Creek Transmission Main
7,300-ft of 20-in Sized for Buildout

New PRV Set to 103-psi

8,500-ft of 12-in Pipe Within Existing Force Main Easement

Annual Pipe Replacement Program

The District currently maintains approximately 54 miles of distribution lines 4-inches and greater. The average useful life of pipe is approximately 100-years. To prevent deferring maintenance, the District should plan to replace approximately 0.5 miles of pipeline each year once the Zone C1 Main Improvements are complete.

Pipe mains are recommended to be replaced with new pipe sized to meet the District Standards under buildout conditions. Appendix A lists all of the distribution system pipe segments that need to be upsized to meet buildout conditions. Pipe segments not listed in Appendix A are recommended to be replaced in kind. The pipes listed in Appendix A have been sized to meet the District’s design criteria under both buildout PHD and MMD plus Fire Flow conditions.

Annual Infrastructure Repair and Replacement Program

A life cycle assessment was prepared to update the annual budget required by the District’s Repair and Replacement Program (R&R) required to maintain the existing facilities. Based on the value of District assets, the District should allocate at least \$464,000 annually for R&R. Table 24 presents a summary of District Assets, their value, their lifetime, and the annual cost of R&R.

Table 24. Annual Rehabilitation and Replacement Program Costs

Asset	Present Value	Lifetime (years)	Annual R&R Cost (\$/year)
Copper Cove WTP & WTP Pump Station	\$8,000,000 ¹	30	\$267,000
Raw Water Pump Station & Pipeline	\$1,500,000 ¹	30	\$50,000
C Tank and Copperopolis Pump Stations	\$750,000 ¹	30	\$25,000
B Tank No. 1	\$450,000 ²	50	\$9,000
B Tank No. 2	\$937,000 ³	50	\$19,000
C Tank No. 1	\$815,000 ²	50	\$16,000
C Tank No. 2	\$815,000 ²	50	\$16,000
Copperopolis Tank	\$815,000 ²	50	\$16,000
Annual Cost of R&R Program			\$418,000
¹ Per 2014 Capacity Charge Update Escalated to 2018 dollars.			
² Cost based on \$1.50 per gallon for new storage tank.			
³ Cost based on \$1.25 per gallon for new storage tank.			

Capital Improvement Plan

Recommendations for a CIP have been developed based on the recommended projects presented in the prior chapters. The following section summarizes project recommendations, estimates the cost of each of the recommended projects and presents a prioritized implementation schedule.

Summary of Recommended Improvements and Implementation Schedule

Seven projects and two repair programs are recommended in response to the current conditions of the Copper Cove water system. The Projects have been listed in order of highest priority to lowest; 1 being the highest priority. Priority has been given to the clearwell and B Tanks improvements as they are essential to providing water to the entire system. The remaining projects were prioritized in order of the number of system deficiencies addressed. The Copperopolis Pump Station Project was given the lowest project priority given the dependence on future development in Copperopolis and can be deferred until development progresses or until the existing pumps begin to fail.

Table 25. Recommended Improvements

Priority	Projects/ Programs	Project Description	Project Goals
1	Water Treatment Plant Clearwell Improvement Project	Rehabilitate WTP Clearwell	Maintain safe and reliable of water supply
2	B Tank No. 1 Replacement Project	Replace existing redwood tank with a 500,000-gallon welded steel tank	Maintain system storage capacity requirement
3	B Tank No. 1 Rehabilitation Project	Repair rafters, roof and interior and exterior coating	Maintain system storage capacity requirement
4	C1 and Saddle Creek Transmission Main Project	Construct transmission main and pump station to supply Zones C1 and C3 (Saddle Creek)	Replace B-C Pump Station, relieve high-pressure deficiencies in C1 and C3, relieve high-velocity deficiencies, reduce pump energy and reduce system water age
5	B4 Backup Main Project	Secondary main around Lake Tulloch	Provides redundant water supply to Zone C4.
6	C4 Loop Main Project	Loops Zone B1 and C4	Provides redundant water supply to Zones B4 and relieves fire flow deficiency
7	Copperopolis Pump Station Project	Replacement of existing pumps	Increase pump station capacity
8	Annual Pipe Replacement Program	Pipeline replacement	Replace one percent of existing distribution system pipelines annually
9	Annual Infrastructure Repair and Replacement Program	Replace or rehabilitate District assets	Maintain District assets

The Projects have been broken into three phases such that all of the projects are addressed within the next 10 years and that the replacement programs are implemented following completion of the first two phases. Phases are intended to be implemented over 5-year periods according to the following schedule:

- Phase I – (2019-2023)
 - WTP Clearwell Improvements
 - B Tank #1 Replacement
 - B Tank #2 Rehabilitation
 - C1 and Saddle Creek Transmission Main Project
- Phase II – (2024-2028)
 - B4 Backup Main Project
 - C4 Loop Main Project
 - Copperopolis Pump Station Project
- Phase III – Annual Repair and Replacement Programs (2029 and Beyond)
 - Annual Pipe Repair and Replacement Program
 - Annual Infrastructure Repair and Replacement Program

Estimated Costs

Planning-level cost estimates are present in Table 26 for each of the recommended capital improvement projects.

The recommended projects, estimated costs, and proposed schedule were developed through a planning-level analysis that was appropriate for the WMP update and should be revaluated in further detail prior to implementation.

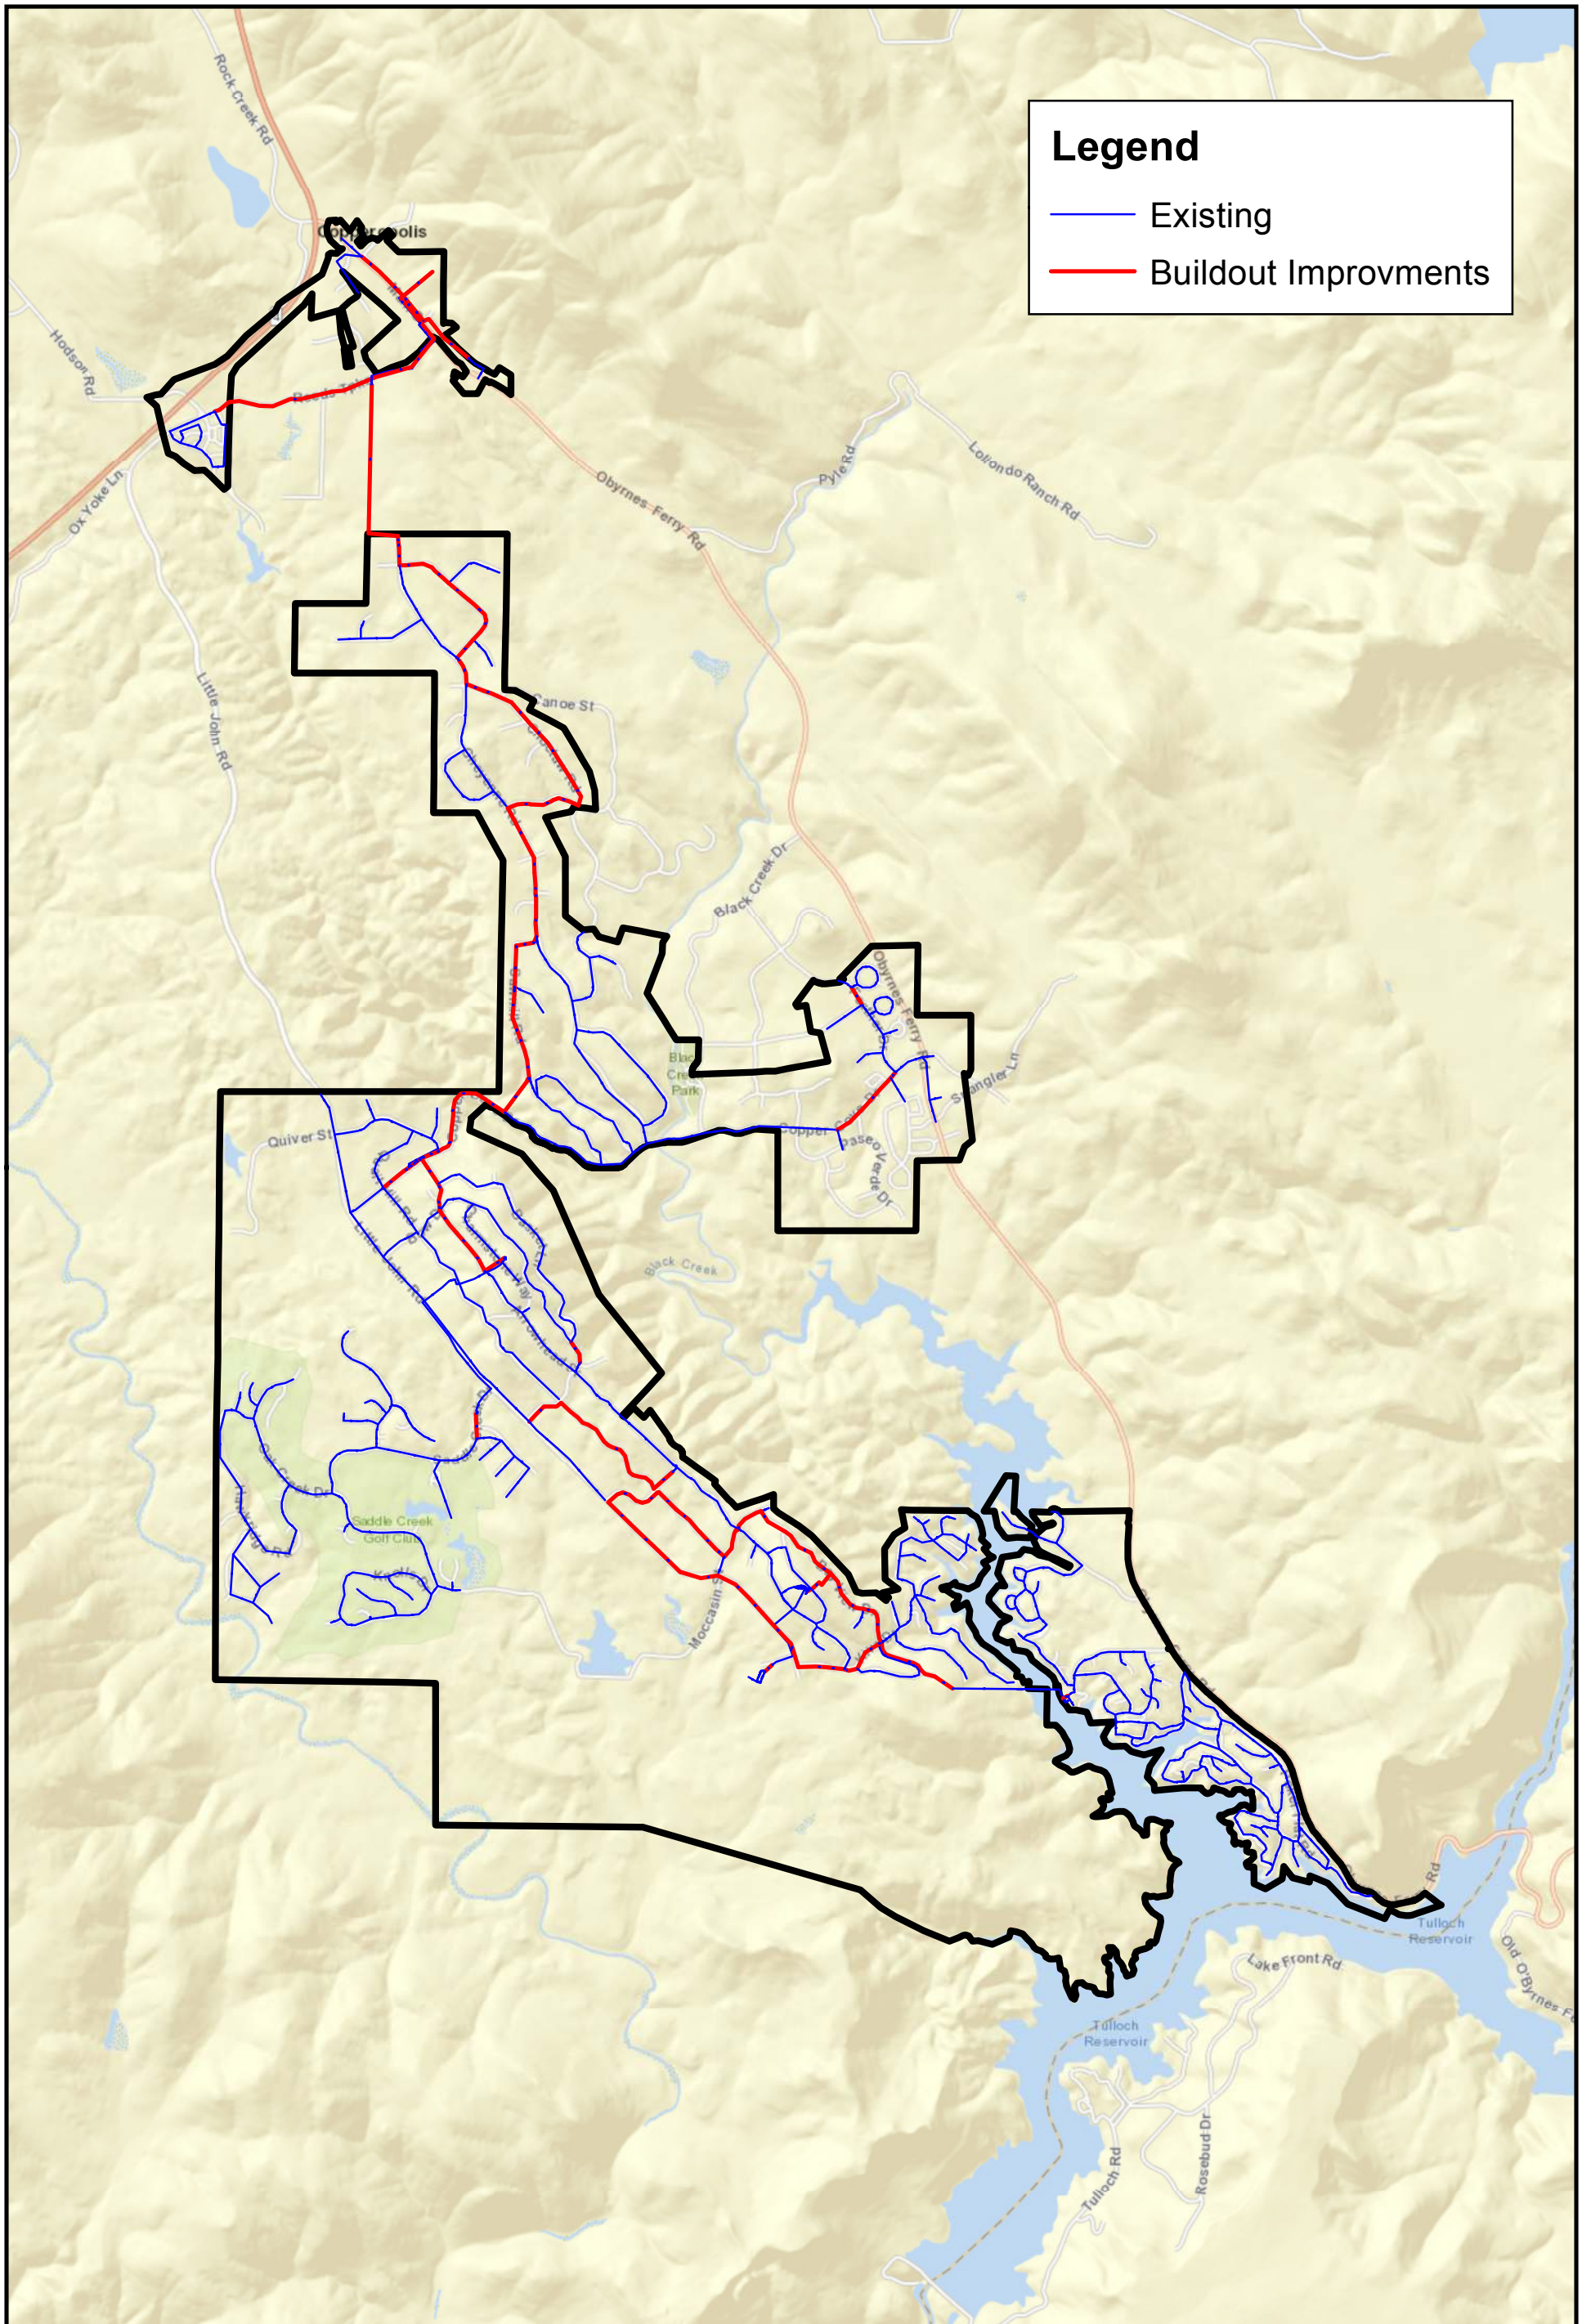

Table 26. Estimated Costs of Capital Improvement, Replacement and Rehabilitation Projects

Phase I: 2019-2023						
Project / Program	Recommended Improvements	Quantity	Unit	Unit Cost	Component Cost	Project Cost
WTP Clearwell Improvements	Aluminum Dome Roof	1	LS	\$500,000	\$500,000	\$750,000
	Recoat Clearwell	1	LS	\$250,000	\$250,000	
B Tank No. 1 Replacement	500,000-Gallon Replacement Tank	1	LS	\$750,000	\$750,000	\$750,000
B Tank No. 2 Rehabilitation	Coating, Rafters, and Roof Rehabilitation	1	LS	\$400,000	\$400,000	\$400,000
C1 and Saddle Creek Transmission Main Project	20-inch Pipeline	11,800	FT	\$690	\$8,142,000	\$8,652,000
	Pump Station to C Tank	1	LS	\$500,000	\$500,000	
	PRV Station	1	EA	\$10,000	\$10,000	
Phase I Total						\$10,552,000
Phase II: 2024-2028						
Project / Program	Recommended Improvements	Quantity	Unit	Unit Cost	Component Cost	Project Cost
B4 Backup Main Project	12-inch Pipeline	1,000	FT	\$1,250	\$1,250,000	\$1,260,000
	PRV Station	1	EA	\$10,000	\$10,000	
C4 Loop Main Project	12-inch Pipeline	8,500	FT	\$414	\$3,519,000	\$3,529,000
	PRV Station	1	EA	\$10,000	\$10,000	
Copperopolis Pump Station	Replace Pumps and Upgraded Electrical Systems	1	LS	\$400,000	\$400,000	\$400,000
Phase II Total						\$5,189,000
Phase III: 2029 and Beyond						
Project / Program	Recommended Improvements	Quantity	Unit	Unit Cost	Component Cost	Project Cost
Annual Rehabilitation and Replacement Program	Miscellaneous R & R Projects	5	Years	\$418,000 ¹	\$2,090,000	\$6,465,000
Annual Pipe Repair and Replacement Program	One Percent (1%) Distribution Piping System	5	Years	\$875,000 ²	\$4,375,000	
Phase III Total						\$6,465,000
Total Cost of Implementation						\$22,206,000
¹ See Table 24 for program costs ² Distribution system pipeline present value estimated at \$34.50 per inch diameter per foot of length.
